COSMO BIO CO., LTD.
Inspiration for Life Science

About Cosmo Bio

Established in 1978, Cosmo Bio provides the most up-to-date products and technical information available from world-class manufacturers, to laboratories, research institutes, life-science education and testing organizations throughout Japan and around the world.
We are proud that our ability to supply a vast array of products and information allows us to serve the needs of all of our customers. By making full use of our international network, coupled with the highest quality information, we support the life sciences community with a level of commitment and responsibility befitting a company that is trusted by its valued customers.

Research Reagents for Immunology

Monoclonal antibodies, polyclonal antibodies, labeled antisera, special antisera, purified antigens, and physiologically active substances

Research Reagents for Gene Engineering

Restriction enzymes, modification enzymes, nucleic acids, reagents for detecting genes, PCR-related reagents, and equipment

Research Reagents for Tissue Culture

Animal serums, media, culture systems/apparatus, and antibiotics

Miscellaneous Research Reagents for Biochemistry

Sugars, lipids, lectins, hormones, peptides, amino acids, chemical substances, virus, bacteria, enzymes, and enzyme substrates

Apparatus for Biochemical Research

Electrophoresis apparatus, cell-gene operation equipment, analysis software, isolation-refining equipment, culture apparatus, measuring instruments, gel photograph devices and related products, disposable products, biohazard safety appliances, and auxiliary equipment for experiments such as cold insulation

Contents

Abbreviations Guide

Cross Reactivity

ALL	All Species	**HU**	Human
AV	Avian	**MAM**	Mammalian
BOV	Bovine	**MKY**	Monkey
CAN	Canine	**MS**	Mouse
CHK	Chicken	**POR**	Porcine
EQ	Equine	**RAB**	Rabbit
FEL	Feline	**RAT**	Rat
GP	Guinea Pig	**SHP**	Sheep
GT	Goat	**XEN**	*Xenopus laevis*
HAM	Hamster	**YST**	Yeast
HIV	Human Immunodeficiency Virus		

Applications

Agg.	Agglutinating	**IF**	Immunofluorescence
ChIP	Chromatin Immunoprecipitation	**IHC**	Immunohistochemistry
DB	Dot Blot	**IHC(f)**	IHC frozen section
EIA	Enzyme Immunoassay	**IHC(p)**	IHC paraffin section
ELISA	Enzyme Linked Immunosorbent Assay	**IP**	Immunoprecipitation
FC	Flow Cytometry	**LM**	Light Microscopy
Gel Shift	Gel Shift Assay	**Neu**	Neutralising
IA	Immunoassay	**RIA**	Radioimmunoassay
IB	Immunoblot	**WB**	Western Blot
IC	Immunocytochemistry (cell)		

Conjugation

2AP	2-Aminopyridine	**HRP**	Horseradish Peroxidase
ALP	Alkaline Phosphatase	**PE**	Phycoerythrin
Cy	Cyanine	**TXRD**	TEXAS RED®
FITC	Fluorescein Isothiocyanate		

COSMO BIO CO., LTD.
Inspiration for Life Science

General Information

International orders

You can purchase our products from our distributors around the world.

Please contact the distributor near your country.
http://www.cosmobio.co.jp/export_e/order/distributors.asp

If you are located in the USA, please contact Cosmo Bio USA

Cosmo Bio USA, Inc.
2792 Loker Avenue West, Suite 101
Carlsbad, California 92010, USA
Phone: 760-431-4600
Fax: 760-431-4604
E-mail: info@cosmobiousa.com
Website: www.cosmobiousa.com

Direct ordering from us

You can also place your orders directly to us:

E-mail: export@cosmobio.co.jp

Phone: +81-(0)3-5632-9617

FAX: +81-(0)3-5632-9618

From our Online Shopping site: http://www.cosmobio.com

Regarding our terms and conditions, packing and shipping, please refer to our website
http://www.cosmobio.com

Technical Service

Our highly trained technical staff is always available to assist you. Please include the catalogue number and product name if available upon sending us your inquiry.

E-mail: export@cosmobio.co.jp or visit our website at www.cosmobio.com

Phone: +81-(0)3-5632-9617

Online Registration & Ordering

Online Registration

1 Click on “Online Shopping”

www.cosmobio.com

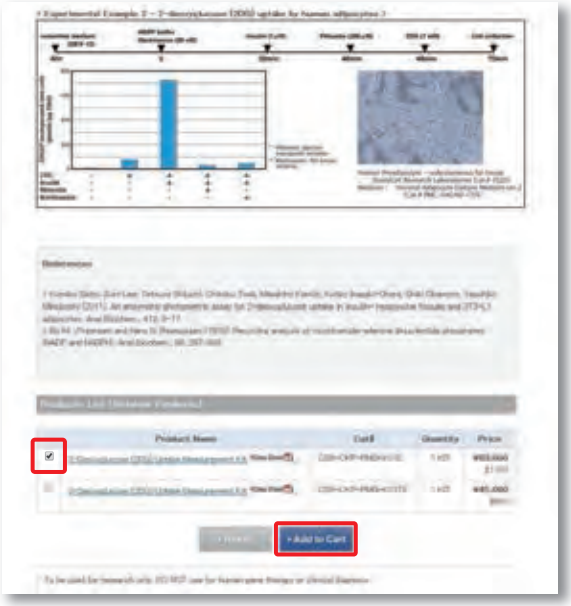
2 Click on “Customer Registration”

3 Confirm “Terms and Conditions” and click on “Agree”

4 Enter “Customer details” and click on “Registration Confirmation”

Ordering from our Online Shopping Site

1 Check the box of the item you would like to purchase and click on “Add to Cart”



2 Confirm the product and quantity and click on “Order details”

3 Enter your Login ID and Password and click on “Login”

4 Confirm your order and click on “Order confirmation”

5 Enter your credit card information and click on “Submit”

6 You will receive an automated “Order Acceptance Notification” by e-mail

Please keep a record of your order number for future reference

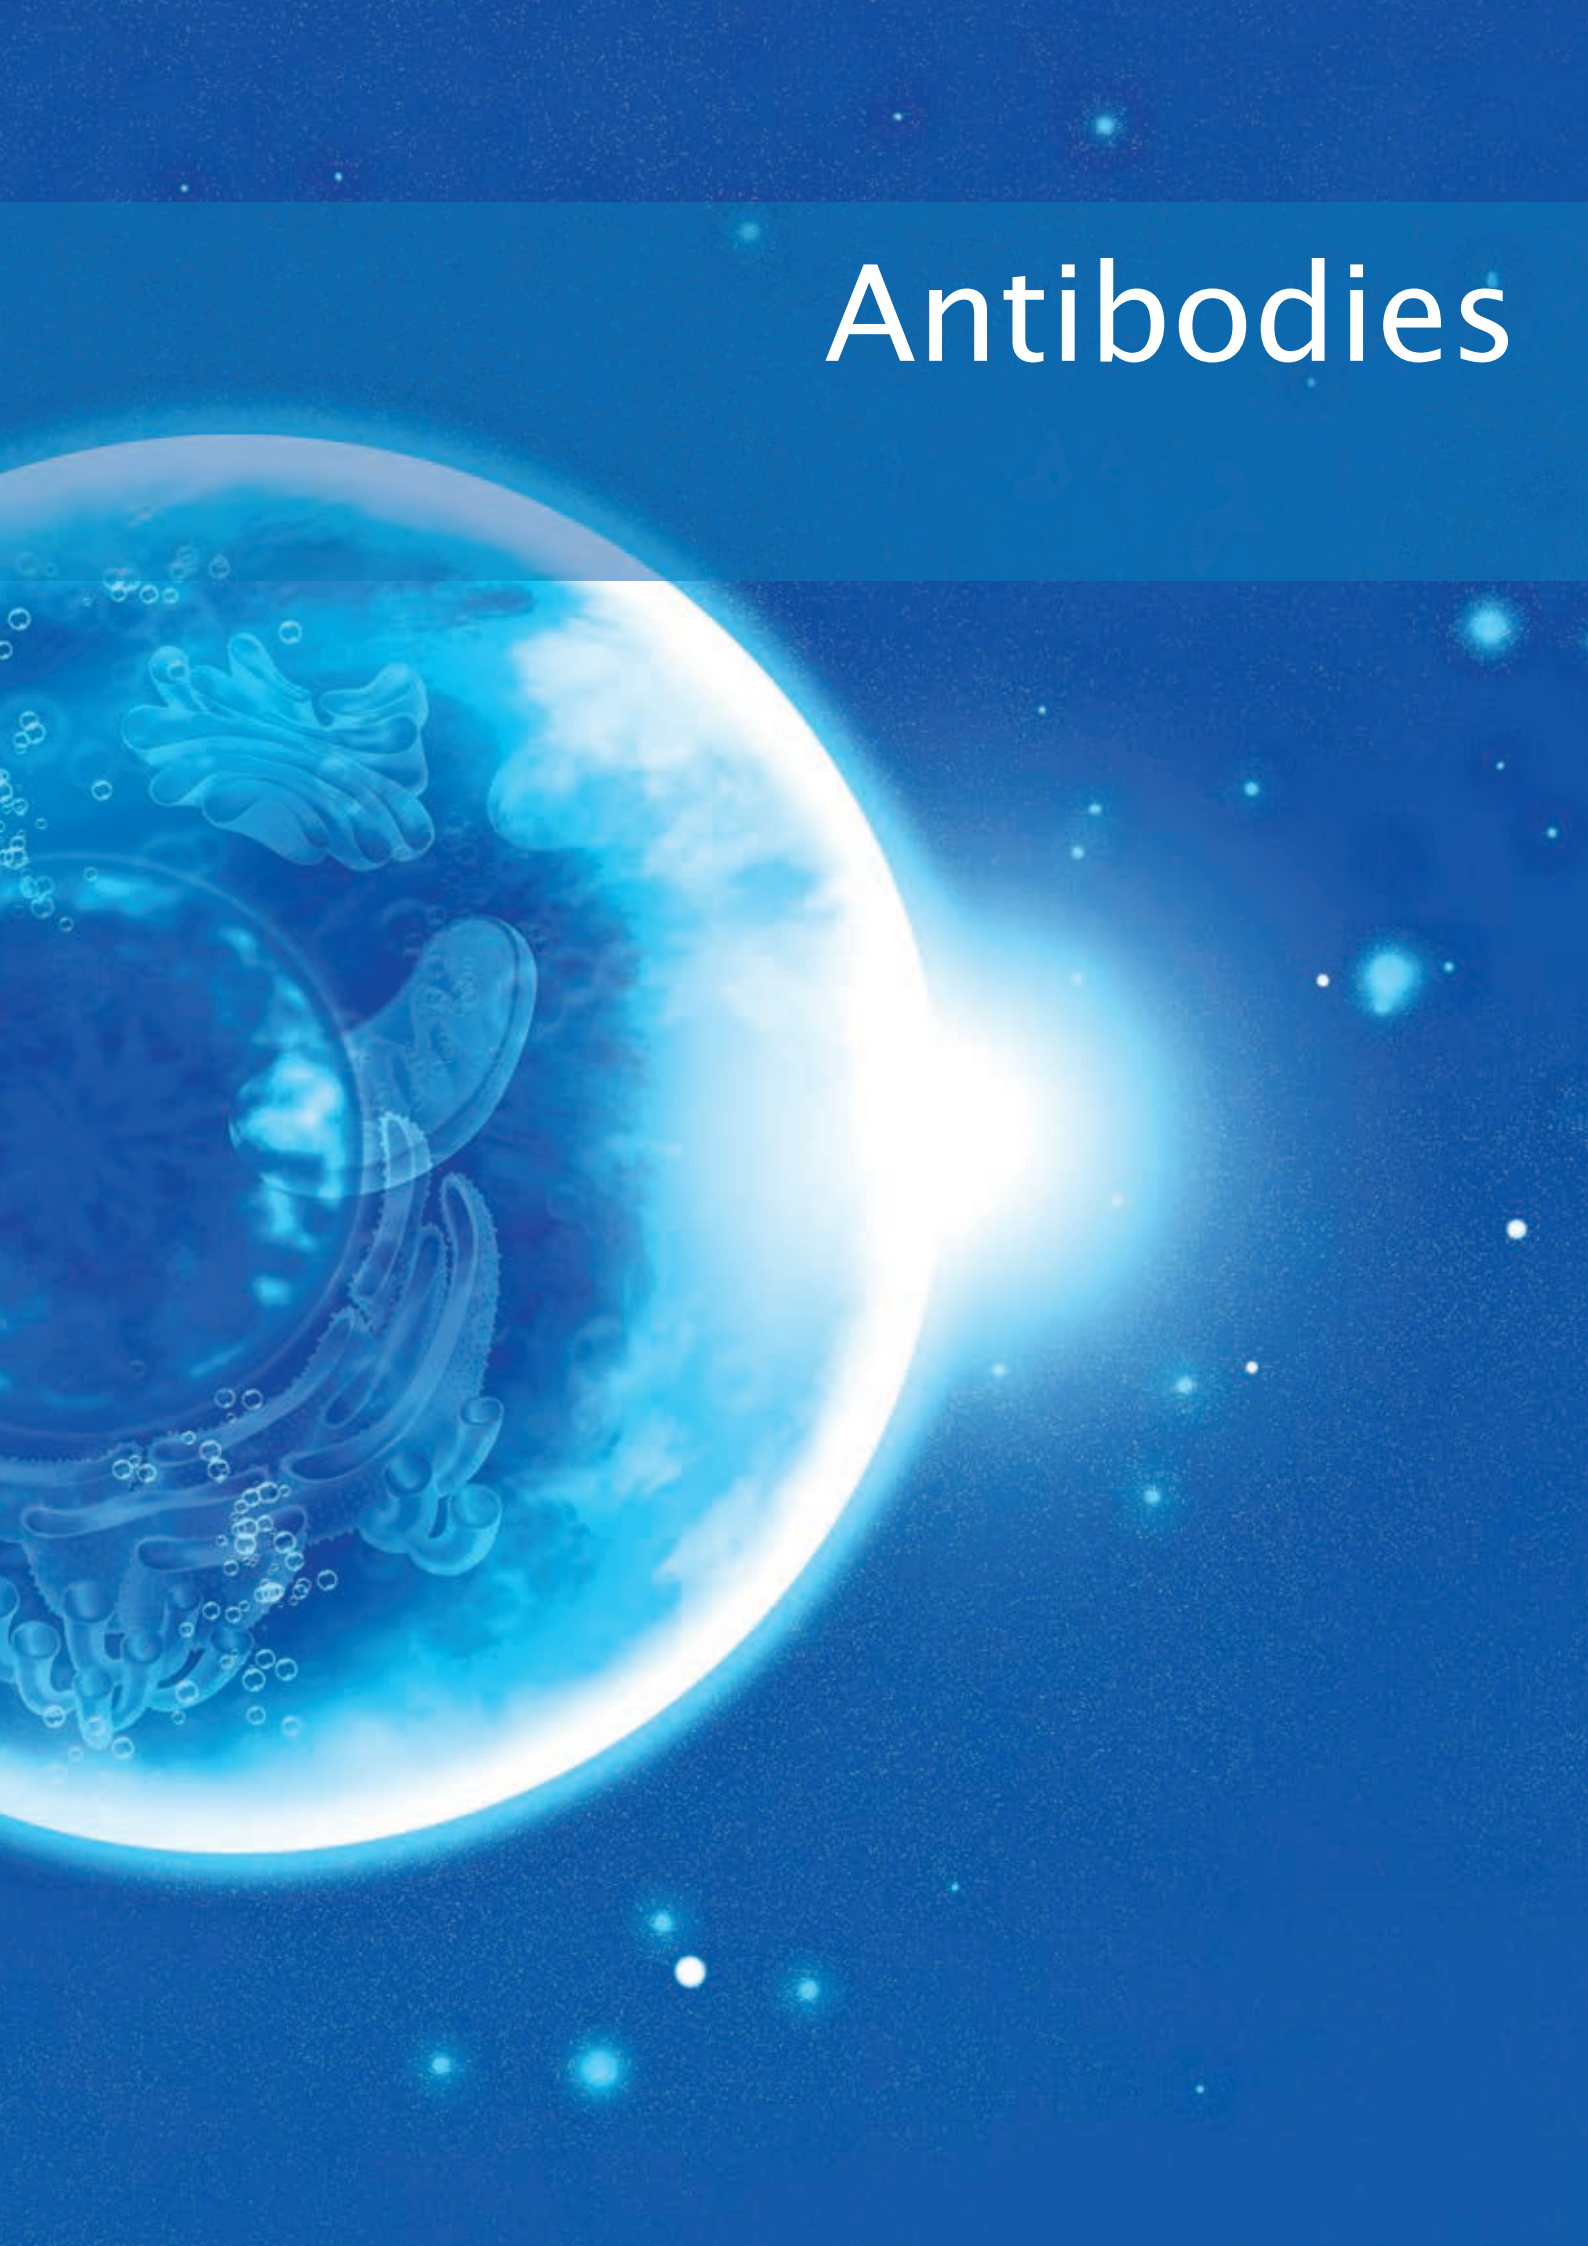
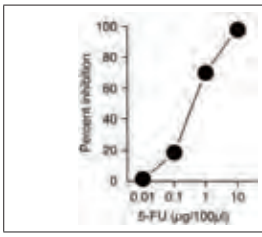
Antibodies

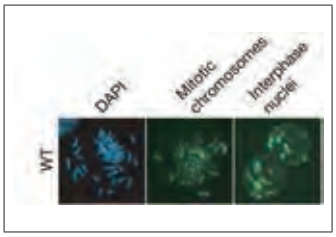


Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
Numeric							
2-Methoxyestrone	Polyclonal	RAB	–	RIA	–	FKA-216	2000 test
	Polyclonal	RAB	–	EIA	–	FKA-216-E	2000 test
3-DG-Imidazolone	Monoclonal JNH-27	MS/IgG1	–	IHC	–	KAL-KH043	50 µg
4-Androstenetrione	Polyclonal	RAB	–	–	–	FKA-150E	2000 test
4F2 Heavy Chain / 4F2hc / CD98	Polyclonal	RAB/IgG	HU/RAT	IHC	–	KAL-KE020	250 µg
	Polyclonal	RAB/IgG	MS/RAT	WB/IHC	–	KAL-KE028	25 µg
4-HHE (4-Hydroxy-2-Hexenal)	Monoclonal HHE53	MS/IgG1 κ	–	IHC	–	NOF-N213730-EX	30 µg
4-HNE	Monoclonal HNEJ-2	MS	–	IHC/WB	–	NNS-MHN-020P-EX	20 µg
	Monoclonal HNEJ-2	MS	–	IHC/WB	–	NNS-MHN-100P-EX	100 µg
4-Methoxyestrone	Polyclonal	RAB	–	RIA	–	FKA-218	2000 test
	Polyclonal	RAB	–	EIA	–	FKA-218-E	2000 test
(4R)-Hydroxy-2-nonenal-Protein	Monoclonal R310	MS/IgG	–	WB/IHC	–	CAC-N-53000801	30 µg
4R-tau Peptide	Polyclonal	RAB/IgG	HU/MS/RAT	WB/IHC	–	CAC-TIP-4RT-P01	50 µℓ
5α-Androstane-3α, 11α, 17β-Triol-11-Succ-17-Glucuronide-BSA	Polyclonal	RAB	–	EIA	–	FKA-146	2000 test
5α-Androstane-3α, 17β-diol	Polyclonal	RAB	–	RIA	–	FKA-130	2000 test
5α-Androstane-3α, 17β-diol-3-glucuronide	Polyclonal	RAB	–	RIA	–	FKA-142	2000 test
	–	RAB	–	RIA	–	FKA-144	2000 test
5α-Androstane-3α, 17β-diol-3-Glucuronide-BSA	Polyclonal	RAB	–	EIA	–	FKA-142-E	2000 test
5α-Androstane-3α, 19β-diol	Polyclonal	RAB	–	EIA	–	FKA-130-E	2000 test
5α-Pregnane-3-20-dione	Polyclonal	RAB	–	RIA	–	FKA-322	2000 test
	Polyclonal	RAB	–	EIA	–	FKA-322-E	2000 test
5β Androstane-3A (5β-Androstane-3α, 17β-diol-glucuronide)	Polyclonal	RAB	–	EIA	–	FKA-132-E	2000 test
	Polyclonal	RAB	–	RIA	–	FKA-132	2000 test
5-Fluorouracil	Monoclonal H3-17	MS	–	ELISA	–	CAC-NM-MA-002	1 vial
5-Methylcytosine	Monoclonal 5MC-CD	MS/IgM	–	IB	–	BAM-51-003-EX	100 µg
	Monoclonal 5MC-CD	MS/IgM	–	IB	Biotin	BAM-51-004-EX	50 µg
	Monoclonal 5MC-CD	MS/IgM	–	IHC/IB	FITC	BAM-51-005-EX	50 µg
6β-OH-Cortisol	Polyclonal	RAB	–	RIA	–	FKA-432	2000 test
	Polyclonal	RAB	–	ELISA	–	FKA-432-E	2000 test
6-pyruvoyltetrahydropterin synthase	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-PTS-249	100 µℓ
7-KC (7-Ketocholesterol)	Monoclonal	MS/IgG	–	IHC(f)	–	NOF-N213810-EX	100 µg
	Monoclonal	MS/IgG	–	IHC(f)	–	NOF-N213820-EX	20 µg
8-OHdG	Monoclonal N45.1	MS	–	IHC	–	NNS-MOG-020P-EX	20 µg
	Monoclonal N45.1	MS	–	IHC	–	NNS-MOG-100P-EX	100 µg
11β-OH-Testosterone	Polyclonal	RAB	–	–	–	FKA-148E	2000 test
11B-OH-ANDROSTENEDION	Polyclonal	RAB	–	EIA	–	FKA-140-E	2000 test

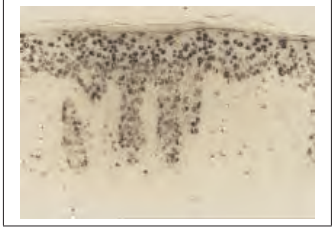
4R-tau peptide #CAC-TIP-4RT-P01
Immuno staining for paraffin embedded section of cerebral cortex prepared from AD brain (retrieved with proteinase K and formic acid).



5-Fluorouracil #CAC-NM-MA-002
Monoclonal antibody (H3-17) is capable of binding to free 5-FU.Free 5-FU efficiently inhibits the antibody binding to immobilized 5-FU-BSA (5 ng/well), which was detected by a competitive ELISA.



5-Methylcytosine #BAM-51-004-EX
Detection of DNA methylation in mouse embryonic stem cells by immunofluorescence staining with the anti-5MeC antibody Intense 5-methylcytosine staining at pericentromeric regions was seen in the mitotic chromosome and interphase nuclei of ESCs.



8-OHdG #NNS-MOG-020P-EX

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
11-Oxo-Testosterone	Polyclonal	RAB	HU/BOV/EQ/ MAM/Fish	RIA	–	FKA-118	2000 test
	Polyclonal	RAB	–	EIA	–	FKA-118-E	2000 test
16α-OH-4-Androstendione	Polyclonal	RAB	–	RIA	–	FKA-124	2000 test
	Polyclonal	RAB	–	EIA	–	FKA-124-E	2000 test
16α-OH-DHA	Polyclonal	RAB	–	RIA	–	FKA-126	2000 test

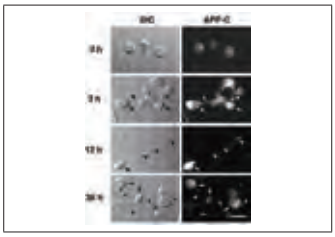
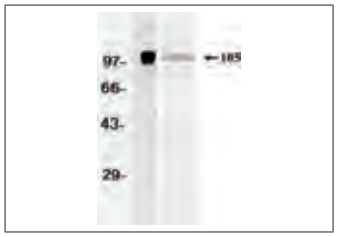
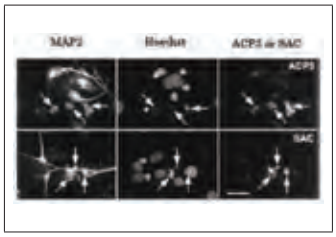
APEX1 (APEX nuclease (multifunctional DNA repair enzyme) 1)
#CAC-CNP-APEX1-468



APP #BAM-74-104-EX
Immunocytochemistry for APP. Mouse dorsal root ganglion neurons were cultured in the presence of nerve growth factor (NGF), fixed at indicated time points, and immunostained for the C-terminus of APP with this antibody.



APP (β-amyloid precursor protein)
#CAC-YCU-MK-AP01



APP δ C31 #BAM-74-110-EX
Immunocytochemical analysis of APPΔC31: Caspase-3 activation and generation of the caspase-cleaved fragment APPΔC31 within neurons induced by serum deprivation.

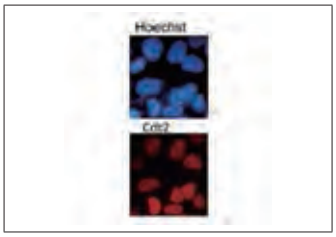
CDKN2C (cyclin-dependent kinase inhibitor 2C (p18, inhibits CDK4), transcript variant 1)
#CBX-CBX00636

CDT2 #BAM-70-115-EX
Inhibition of Cdt2 protein synthesis by Cdt2 siRNA introduced into HeLa cells. siCont is control siRNA unrelated to Cdt2. siCdt2 is Cdt2 siRNA. Cdt2 is phosphorylated after UV irradiation as shown by the band shift-up in irradiated sample (UV +).



CDT2 #BAM-70-115-EX
Immunofluorescence staining of Cdt2 protein in growing Hela cells with the antibody. Asynchroneously growing HeLa cells were stained with Hoechst 33258 for DNA and with the antibody for Cdt2 protein.

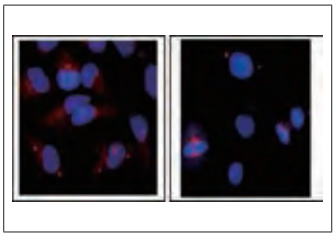
CENPN (centromere protein N)
#CAC-CNP-CENPN-398



Centrin 1 #BAM-70-110-EX
Immunofluorescence staining of Centrin 1 protein in HeLa cells with anti-Centrin 1 antibody. Growing HeLa cells were fixed with 4% paraformaldehyde, and permeabilized with 0.25% Triton X-100. Anti-Centrin 1 antibody was used at 1/100 dilution. As 2nd antibody, goat anti-rabbit IgG conjugated with Alex 488 (red) at 1/1,000 dilution. DNA was stained with DAPI (blue).

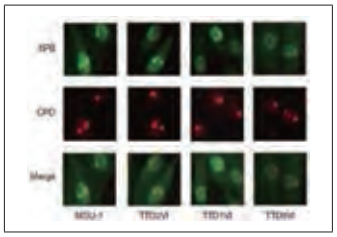
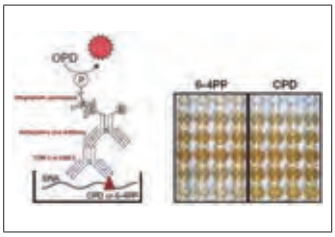
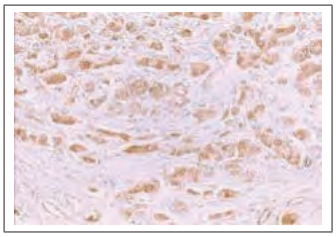
	Polyclonal	RAB	HU	–	–	NBT-PG-022	5 mℓ



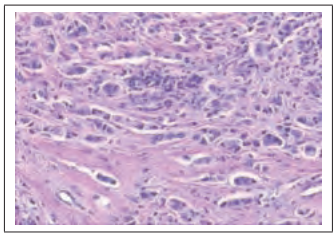
CPDs #CAC-NM-DND-001
in situ Visualization of XPB and CPD 30 min after micropore UV irradiation.



CPDs #CAC-NM-DND-001
A sensitive ELISA for measuring UV-induced DNA damage.



CRF21 #CAC-TSS-M01



CRF21 #CAC-TSS-M01

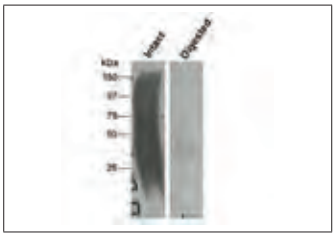
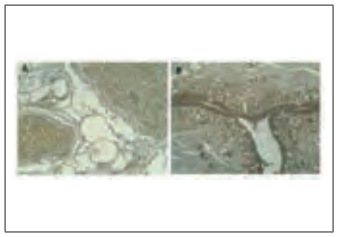
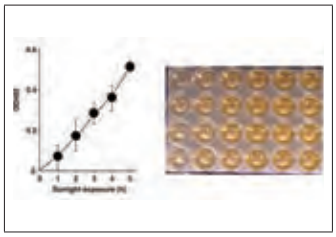
DDX47 #BAM-70-455-EX
HeLa cells were fixed and immunostained with anti-DDX47 antibody followed by FITC-conjugated anti-rabbit IgG secondary antibody. DNA was stained with Hoechst dye.



Decorin #CAC-PRPG-DC-M01
Western blotting: Bovine decorin after SDS-PAGE on 8% gels
Left : Intact, smeared band 50-140 kDa;
Right : Chondroitinase ABC-digested, band at 60-70 kDa.



Decorin #CAC-PRPG-DC-M01
Immunohistochemistry
A: Human prostate
B: Human breast



Dewar PPs (Dewar photoproducts)
#CAC-NM-DND-003
Solar UV-induced DewarPPs are detected by ELISA.

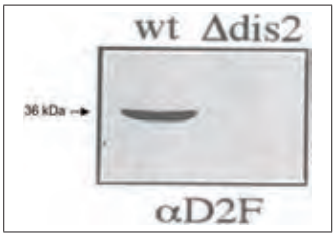
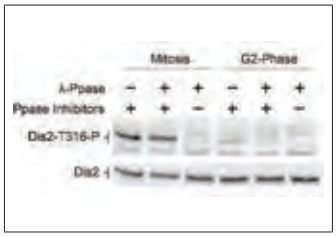
Dewar PPs (Dewar photoproducts)
#CAC-NM-DND-003
Fluorescent images of DewarPPs in normal human fibroblasts.



Dis2 #BAM-63-119-EX
Immunoblot of wild-type and ¬dis2 S.pombe cells using anti-dis2 antibody, ΔD2F.
wt: wild type
Δdis2: dis2 deletion mutant

Dis2 #BAM-63-119-EX
Immunoprecipitation of wild-type S. pombe extracts was performed using anti-dis2 antibody, D2F.



Dis2 #BAM-63-121EX
Identification of Dis2 phosphorylated at T316 by western blotting with the antibody.

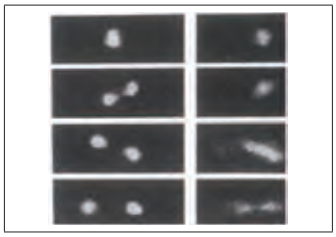
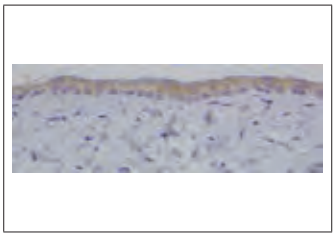
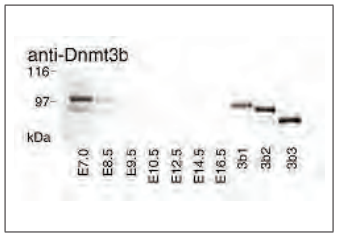
DNA Polymerase DELTA subunit p66	Monoclonal 2A1C11	MS/IgG2b κ	HU	WB/IP	–	BAM-70-055EX	20 µg
	Monoclonal 2A1C11	MS/IgG2b κ	HU	WB/IP	–	BAM-70-056EX	100 µg
DNA Polymerase eta	Monoclonal 5H10	MS/IgG1 κ	HU	WB/IF	–	BAM-70-070EX	20 µg
	Monoclonal 5H10	MS/IgG1 κ	HU	WB/IF	–	BAM-70-071EX	100 µg
Dnmt3b	Polyclonal	RAB	HU/MS/RAT	WB/IHC/ChIP/IF	–	BAM-70-205-EX	20 µg
	Polyclonal	RAB	HU/MS/RAT	WB/IHC/ChIP/IF	–	BAM-70-206-EX	100 µg
DNMT3B (DNA (cytosine-5-)-Methyltransferase 3 β)	Monoclonal 2280C3a	MS/IgG2b	HU/MS/RAT	WB/IC/FC/DB	–	CBX-CBX00392	100 µg
Dnmt1 (1-248)	Polyclonal	RAB	MS/HU	WB/IF/IP	–	BAM-70-201-EX	50 µg
Dnmt1 (1037-1386)	Polyclonal	RAB	MS/HU	WB/IF/IP	–	BAM-70-203-EX	50 µg
DNP	Monoclonal 2-9(4)	MS/IgE	–	–	–	YMS-7676	100 µg
DNP-Ascaris	Polyclonal	RAT	–	IHC	–	LSL-LB-9009	100 µℓ
DNTTIP1 (Deoxynucleotidyltransferase, Terminal, Interacting Protein 1)	Monoclonal 2281C2a	MS/IgG1	HU	WB/IC/DB	–	CBX-CBX00448	100 µg
DOC (Deoxycorticosterone)	Polyclonal	RAB	–	EIA	–	FKA-422-E	2000 test
DOCK4 (KIAA0716)	Polyclonal	RAB/IgG	MS	WB	–	PRX-MK07160910	50 µg
DOCK7 (Dedicator of Cytokinesis 7)	Monoclonal 3540C1a	MS/IgG1	HU	WB/DB	–	CBX-CBX00763	100 µg
DOK1 (Docking protein 1 (downstream of tyrosine kinase 1))	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-DOK1-325	100 µℓ
DOR	Monoclonal 1E7	MS/IgG1 κ	HU	WB/FC/IC/IP	–	KAL-KG142	25 µg (100 µℓ /vial)



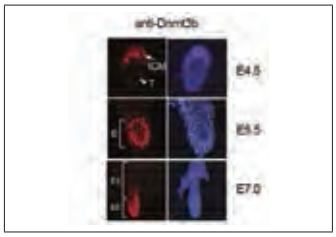
DIS3 #BAM-63-123EX
Localization of the dis3+ gene product by immunofluorescence microscopy. S. pombe cells were fixed and prepared for immunofluorescence microscopy with anti-dis3 antibodies. Left, DAPI stain for chromosomal DNA. Right, anti-Dis3 antibody stain (ref.1).



Dityrosine(DT) #NNS-MDT-020P-EX
Immunohistochemistry: DT staining of mouse skin (Dr. Sugiyama, Tottori Univ.)



Dnmt3b #BAM-70-205-EX
The amounts of Dnmt3b in mouse embryos at the stages of E7.0-E16.5 were examined by Western blotting.



Dnmt3b #BAM-70-205-EX
Expression of Dnmt3b in mouse embryos was examined by immuno-fluorescence staining.

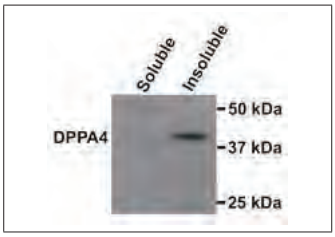
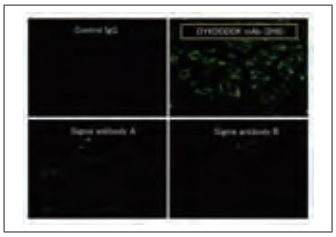
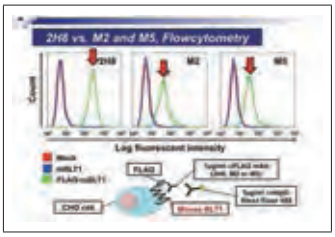
Dppa4 #CAC-TMD-PB-DP4
Conforcal images of ES cells immunostained with anti-DPPA4 antibody.



Dppa4 #CAC-TMD-PB-DP4
Western blot analysis of DPPA4 in chromatin soluble and insoluble fractions.



DYKDDDDK #KAL-KO602-S
This cell staining is done in CHO cell by the DYKDDDDK addition to N-terminus of prostaglandin dehydrogenase. (antibody concentration : 1μg/mℓ).



DYKDDDDK #KAL-KO602-S
Flow cytometry analysis of CHO Cells (GPCR (mouse BLT1) stable expression) with anti-FLAG antibody (1μg/mℓ : 2H8, M2, M5) and anti-Alexa488-mouse IgG.

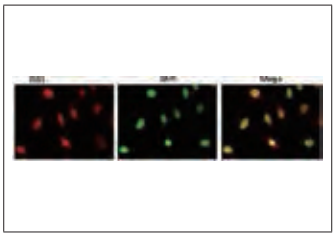
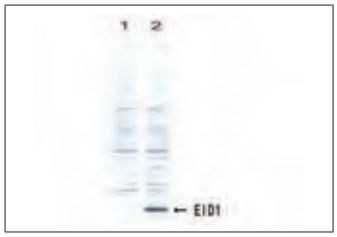
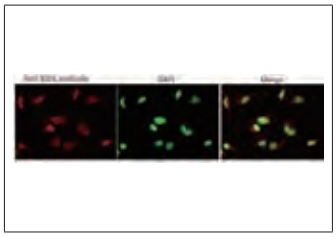
EID1 #BAM-71-185-EX
Identification of the EID1 protein by the monoclonal antibody clone #26 by Western blotting.



EID1 #BAM-71-185-EX
Indirect immunofluorescence staining of EID1 protein by anti-EID1 antibody (clone 26) in HeLa cell.



EID1 #BAM-71-190-EX
Identification of the EID1 protein by the monoclonal antibody (clone #2) by Western blotting.



EID1 #BAM-71-190-EX
Indirect immunofluorescence staining of EID1 protein by anti-EID1 antibody (clone 2) in HeLa cell. EID1 protein is localized in nuclei.

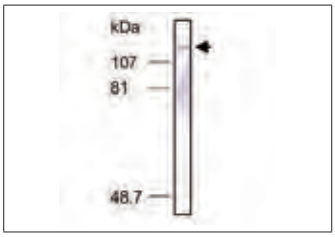
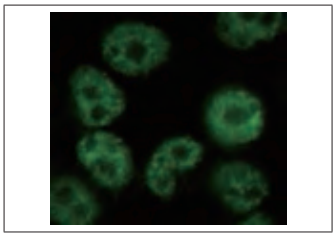
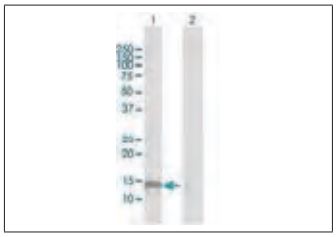
Western blot analysis of immunized recombinant protein, using anti-ETS1 monoclonal antibody.



Exportin-5, (XPO5) #CAC-CE-006A
Western blot - Exportin-5 antibody (1D11) HeLa cell nuclear extracts.



Exportin-5 (XPO5) #CAC-CE-006A
Immunocytochemistry/ Immunofluorescence - Exportin-5 antibody (1D11) HeLa cells.



FABP7 (fatty acid binding protein 7, brain) #CAC-CNP-FABP7-358
Western blot analysis of FABP7 expression in transfected 293T cell line by FABP7 rabbit polyclonal antibody.
Lane 1 : FABP7 transfected lysate (14.63 KDa)
Lane 2 : Non-transfected lysate

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
FAIMS	Polyclonal	RAB	HU/MS/RAT	WB	–	BCN-BCN4779	0.1 mℓ

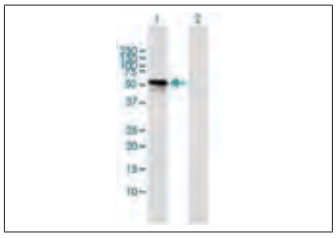
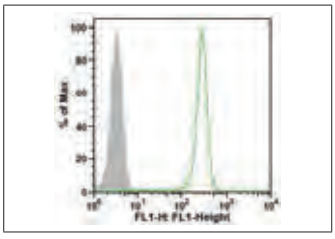
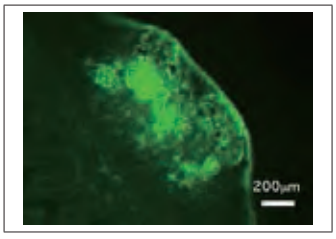
FcALPHA/MUR	Monoclonal TX57	MS/IgG1 κ	MS	FC/IF/IP/Neu	–	KAL-KO571	50 μg (200 μℓ /vial)
	Monoclonal TX61	MS/IgG1 κ	HU/MS	FC/IF/IP	–	KAL-KO572	50 μg (200 μℓ /vial)
Fc ε RI α	Monoclonal CRA1	MS/IgG2b κ	HU	WB/IHC/FC	–	BAM-72-001-EX	100 μg



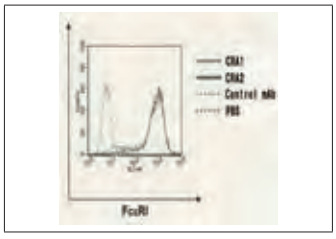
FAM117A (family with sequence similarity 117, member A) #CAC-CNP-FAM117A-404
Western blot analysis of FAM117A expression in transfected 293T cell line by FAM117A rabbit polyclonal antibody.



FcALPHA/MUR #KAL-KO571
Flow cytometry: Mouse FCAMR expressing Ba/F3 cells



FcALPHA/MUR #KAL-KO572
Immunofluorescence, Mouse peyer's patch.



Fc ε RI α #BAM-72-001-EX
FACS analysis of CHO/ α β γ cells (1×10^5) with CRA1 and CRA2 antibodies by indirect-immunostaining method using FITC-labeled secondary antibody.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
Fc ε RI α	Monoclonal CRA1	MS/IgG2b κ	HU	WB/IHC/FC	Biotin	BAM-72-003-EX	50 μg
	Monoclonal CRA1	MS/IgG2b κ	HU	IHC/WB/FC	FITC	BAM-72-004-EX	50 μg

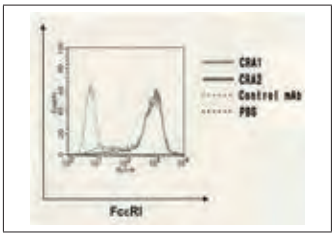
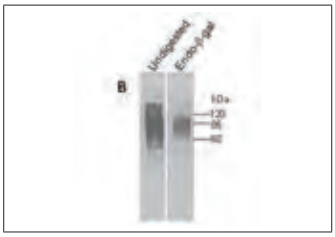
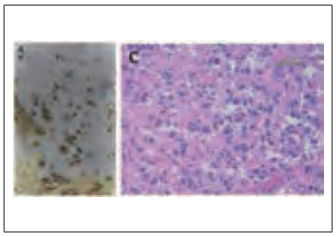
	Monoclonal CRA2	MS/IgG1 κ	HU	WB/IHC/FC	Biotin	BAM-72-007-EX	50 μg
	Monoclonal CRA2	MS/IgG1 κ	HU	WB/IHC/FC	FITC	BAM-72-008-EX	50 μg
FCHO1	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0290	100 μℓ
FCHSD1	Polyclonal	RAB	HU/MS	WB	–	PRX-MFL0007	100 μℓ
FDPS (KIAA1293)	Polyclonal	RAB/IgG	MS	WB/IHC/IP	–	PRX-MK12930505	0.05 mg
FEM1A	Polyclonal	RAB	HU	WB	–	PRX-KB3219GNP	100 μℓ
	Polyclonal	RAB/IgG	HU	WB	–	PRX-KB3219GNPAF	50 μg
FEN1 (Flap Structure-specific Endonuclease 1)	Monoclonal 2357C3a	MS/IgG1	HU	WB/DB/IC	–	CBX-CBX00795	100 μg
FER (fps/fes Related) Tyrosine Kinase (Phosphoprotein NCP94)	Monoclonal 2358C3a	MS/IgG1	HU/MS	WB/IP/DB	–	CBX-CBX00490	100 μg
Ferritin	Monoclonal 5701	MS/IgM	HU	ELISA	–	SIM-2ZHCMF1	0.5 mℓ (0.25 mg /0.5 mℓ)
	Monoclonal 5704	MS/IgM	HU	ELISA	–	SIM-2ZHCMF2	0.5 mℓ (0.25 mg /0.5 mℓ)
FGF Basic	Polyclonal	RAB	BOV	IHC(f)/RIA	–	YII-Y250-EX	50 μℓ
FGF Basic (1-9)	Polyclonal	RAB	HU	IHC/RIA	–	YII-Y251-EX	50 μℓ
Fibrillin	Polyclonal	RAB	HU/MS/RAT/ BOV	ELISA/IF/WB/ IHC	–	LSL-LB-2297	100 μℓ
Fibrinogen	Monoclonal IF-1	MS/IgG1 κ	HU	WB	–	CAC-MKM-M02	100 μg
Fibromodulin	Monoclonal 636B12	MS/IgM	HU	WB/IHC	–	CAC-PRPG-FBM-M01	2 mℓ
Fibronectin	Polyclonal	RAB	HU/MS/RAT/ BOV/GT/GP	ELISA/IF/EIA/ IHC	–	LSL-LB-1027	100 μℓ
Filamin A	Polyclonal	RAB	MS	WB	–	CAC-SU-IZ-P05	100 μℓ
FKBP3 (FK506 Binding Protein 3)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-FKBP3-411	100 μℓ
	Monoclonal 2364C3	MS/IgG1	HU/MS/RAT	WB/IC/DB	–	CBX-CBX00410	100 μg
FKBP11 (FK506 Binding Protein 11)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-FKBP11-206	100 μℓ
Flag	Monoclonal 2H8	MS/IgG2a κ	*HU/Chinese Hamster*	WB/IF/FC/IC/IP	–	KAL-KO602-M	200 μg
FLI1	Polyclonal	RAB	HU	WB	–	PRX-KB5555GNP	100 μℓ
FLJ11184 (Hypothetical Protein FLJ11184)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-C4ORF43-372	100 μℓ
FLJ21908 (RNA Polymerase II Associated Protein 3)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-RPAP3-047	100 μℓ
FLJ22662 (Hypothetical Protein FLJ22662)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-FLJ22662-303	100 μℓ
FLJ39501 (Cytochrome P450, Family 4, Subfamily F, Polypeptide 22)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-CYP4F22-351	100 μℓ
FMNL1 (Formin-like 1)	Monoclonal 2369E4a	MS/IgG1	HU	WB/DB	–	CBX-CBX00540	100 μg
FMNL3	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA2014	100 μℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA2014PA	100 μg
FNBP1	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0554	100 μℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0554PA	100 μg



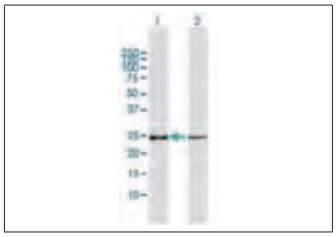
Fc ε RI α #BAM-72-003-EX
FACS analysis of CHO/aby cells (1×10^5) with CRA1 and CRA2 antibodies by indirect-immunostaining using FITC-labeled secondary antibody.



Fibromodulin #CAC-PRPG-FBM-M01
Western blotting of undigested and endo-β-galactosidase-digested human cartilage fibromodulin resolved by SDS-PAGE on 7% gels under reducing conditions.



Fibromodulin #CAC-PRPG-FBM-M01
(A) Immunohistochemical staining of human articular cartilage
(C) Immunohistochemical staining of a leiomyosarcoma lesion

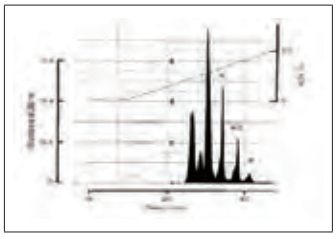


FKBP3 (FK506 binding protein 3, 25kDa) #CAC-CNP-FKBP3-411
Western blot analysis of FKBP3 expression in transfected 293T cell line by FKBP3 rabbit polyclonal antibody.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
FNBP1 (KIAA0554) (Cerebellum, Bergmann glia)	Polyclonal	RAB/IgG	MS	IHC	–	PRX-MK05540310	0.1 mg
FNDC3A	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0970	100 µℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0970PA	100 µg
Follistatin	Polyclonal	RAB/IgG	BOV/MS/RAT	WB/IHC/ELISA/ Neu/RIA	–	CAC-KZ-HS-P08	50 µℓ
FOLR1 (Folate Receptor 1 (Adult))	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-FOLR1-156	100 µℓ
Forskolin	Monoclonal 1A9	MS/IgG1 κ	–	ELISA	–	CAC-KYU-HT-M006	100 µℓ
FOS (V-fos FBJ Murine Osteosarcoma Viral Oncogene Homolog)	Monoclonal 554C1a	MS/IgG1	HU	DB/WB	–	CBX-CBX00428	100 µg
FOXH1 (Forkhead Box H1)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-FOXH1-306	100 µℓ
FOXJ3	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA1041AF	50 µg
FOXL2 (Forkhead Box L2)	Monoclonal 262C1a	MS/IgG1	HU	WB/DB	–	CBX-CBX00594	100 µg
FOXM1 (Forkhead Box M1)	Monoclonal 263C2a	MS/IgG1	HU	WB/DB	–	CBX-CBX00590	100 µg
FOXO	Polyclonal	RAB	*Drosophila*	WB/IP/ChIP	–	CAC-THU-A-DFOXO	100 µℓ
FOXO1A (Forkhead Box O1A (Rhabdomyosarcoma))	Monoclonal 738C3a	MS/IgG1	HU	DB/WB	–	CBX-CBX00660	100 µg
Free κ Chain	Monoclonal 5H11	MS/IgG2b κ	HU	EIA	–	YMS-7641	200 µg
Free λ Chain	Monoclonal 4G7	MS/IgG1 κ	HU	EIA	–	YMS-7642	200 µg
FRG	Polyclonal	RAB/IgG	MS/HU	WB/IP	–	KAL-KR102	100 µg
FRYL (KIAA0826)	Polyclonal	RAB/IgG	MS	WB	–	PRX-MK08260910	50 µg
FSD1 (Fibronectin Type III and SPRY Domain containing 1)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-FSD1-409	100 µℓ
FTSJ2 (FtsJ Homolog 2 (*E. coli*))	Monoclonal 2372C6a	MS/IgG1	HU	WB/DB	–	CBX-CBX00614	100 µg
FUCA2 (Fucosidase, α-L- 2, plasma)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-FUCA2-268	100 µℓ
FXR	Monoclonal A9033A	MS/IgG2a	HU/MS/RAT	WB/IHC/ELISA/ IP	–	PPX-PP-A9033A-00	0.1 mℓ (1 mg/mℓ)

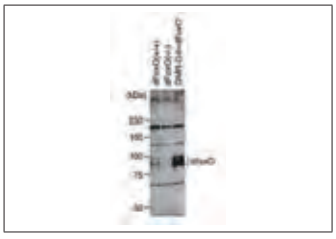
G

G0S2 (G0/G1Switch 2)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-G0S2-175	100 µℓ
G3BP (GTPase Activating Protein (SH3 domain) Binding Protein 1)	Polyclonal	RAB/IgG	HU	IP	–	CAC-CNP-G3BP1-147	100 µℓ
G5PR	Polyclonal	RAB/IgG	MS	WB/IP	–	KAL-KR058	25 µg
G9a (H3-K9-HMTase)	Monoclonal A8620A	MS/IgG2a	HU/MS	WB/IHC/ELISA/ IP	–	PPX-PP-A8620A-00	0.1 mℓ (1 mg/mℓ)
G10 (Maternal G10 Transcript)	Monoclonal G10E2C3	MS/IgG1	HU	WB/DB	–	CBX-CBX00318	100 µg
GABPA	Polyclonal	RAB	HU	WB	–	PRX-KB3911GNP	100 µℓ
GABPA (GA Binding Protein Transcription Factor, α)	Monoclonal 352C3a	MS/IgG1	HU	WB/DB	–	CBX-CBX00589	100 µg
GAL3ST1 (Galactose-3-O-Sulfotransferase 1)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-GAL3S1-017	100 µℓ
Gal11p	Polyclonal	RAB	YST	WB	–	BAM-62-001-EX	50 µℓ
	Polyclonal	RAB	YST	WB	–	BAM-62-002-EX	250 µℓ
Galanin	Polyclonal	RAB	RAT/POR/Tuna/ HU	IHC/RIA	–	YII-Y180-EX	50 µℓ
Galectin 3	Polyclonal	RAB/IgG	HU	WB	–	KAL-KH040	100 µg
Galanin (1-15)	Polyclonal	RAB	HU/RAT/POR	IHC/RIA	–	YII-Y182-EX	50 µℓ



Follistatin #CAC-KZ-HS-P08
Elution profile on reverse-phase HPLC of the partially purified activin-follistain complex of fraction 2 applied to a Cosmosil $5C_{18}$-AR column (10*250 mm).

FOLR1 (folate receptor 1 (adult)) #CAC-CNP-FOLR1-156
Western blot analysis of FOLR1 expression in transfected 293T cell line by FOLR1 rabbit polyclonal antibody.



FOXO #CAC-THU-A-DFOXO
Expression of dFoxO in the fly brain lysates was detected with anti dFoxO (1:3000 dilution) combined with the ECL Plus reagent.

FOXO #CAC-THU-A-DFOXO
Endogenous dFoxO from S2 cells was Immunoprecipitated with anti dFoxO.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
Galanin (9-30)	Polyclonal	RAB	HU/RAT	IHC/RIA	–	YII-Y184-EX	50 µℓ
Galanin (15-29)	Polyclonal	RAB	RAT/HU/POR	IHC/RIA	–	YII-Y183-EX	50 µℓ
Galanin (20-29)	Polyclonal	RAB	RAT/HU	IHC/RIA	–	YII-Y186-EX	50 µℓ
GALE (UDP-Galactose-4-Epimerase)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-GALE-244	100 µℓ
GALK2 (Galactokinase 2)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-GALK2-269	100 µℓ
GALNS (Galactosamine (N-acetyl)-6-sulfate sulfatase (Morquio syndrome, mucopolysaccharidosis type IVA))	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-GALNS-246	100 µℓ
GALNT3 (UDP-N-acetyl-α-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 3 (GalNAc-T3))	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-GALNT3-218	100 µℓ
GALNT9 (UDP-N-acetyl-α-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 9 (GalNAc-T9))	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-GALNT9-276	100 µℓ
GALNT12 (UDP-N-acetyl-α-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 12 (GalNAc-T12))	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-GALNT12-374	100 µℓ
GALPHA (olf)	Polyclonal	RAB/IgG	XEN	WB/ELISA/IHC	–	COP-COP-080058	100 µℓ
γ Glutamyl Transpeptidase	Monoclonal AGT1	MS/IgG1	HU/MS/RAT	WB/IHC	–	ACE-GGT-AGT1EX	100 µg (1 mg/mℓ)
	Monoclonal AGT3	MS/IgG2a	HU	WB	–	ACE-GGT-AGT3EX	100 µg (1 mg/mℓ)
γ Synuclein	Polyclonal	SHP/IgG	HU	IHC(f)/WB	–	ATA-CB-GS1S	0.1 mℓ
γ Tubulin	Polyclonal	RAB	XEN/HU/MS/RAT	WB/IF	–	BAM-69-001-EX	100 µg
GANAB (glucosidase, α; neutral AB)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-GANAB-086	100 µℓ
GAP (28-56)	Polyclonal	RAB	RAT	IHC(f)/RIA	–	YII-Y312-EX	50 µℓ
GAP (34-56)	Polyclonal	RAB	HU/RAT/POR	IHC/RIA	–	YII-Y311-EX	50 µℓ
GA-pyridine (LDL)	Monoclonal 2A2	MS/IgG1	–	WB/ELISA/IHC	–	CAC-AGE-M03	100 µℓ
GARNL1 (GTPase activating Rap/RanGAP domain-like 1)	Monoclonal 2382C1a	MS/IgG1	HU	WB/DB	–	CBX-CBX00512	100 µg
GARNL1 (KIAA0884)	Polyclonal	RAB/IgG	MS	WB	–	PRX-MK08840910	50 µg
GAS7	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0394	100 µℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0394PA	100 µg
Gastric Mucin	Monoclonal HIK1083	MS/IgM κ	RAT	IHC(p)/ELISA	–	KAN-02101-96-EX	50 µℓ (100 µg/mℓ)
	Monoclonal RGM21	MS/IgM κ	RAT	IHC(p)/ELISA	–	KAN-02102-96-EX	50 µℓ (100 µg/mℓ)
	Monoclonal RGM22	MS/IgM κ	RAT	IHC(p)/ELISA	–	KAN-02103-96-EX	50 µℓ (100 µg/mℓ)
	Monoclonal RGM26	MS/IgM κ	RAT	IHC(p)/ELISA	–	KAN-02104-96-EX	50 µℓ (100 µg/mℓ)

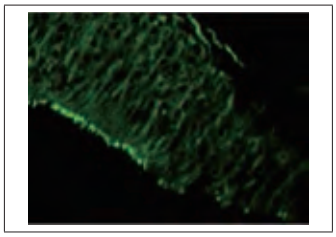
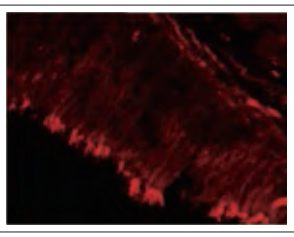
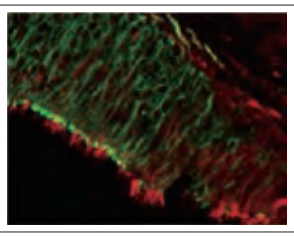
	Monoclonal PGM34	MS/IgM κ	POR	IHC(p)/ELISA	–	KAN-02107-96-EX	50 µℓ (100 µg/mℓ)
	Monoclonal HGM44	MS/IgG1 κ	HU	IHC(p)/ELISA	–	KAN-02108-96-EX	50 µℓ (100 µg/mℓ)
	Monoclonal HGM75	MS/IgG1 κ	HU	IHC(p)/ELISA	–	KAN-02109-96-EX	50 µℓ (100 µg/mℓ)
	Monoclonal HGM504	MS/IgM κ	HU	IHC(p)/ELISA	–	KAN-02110-96-EX	50 µℓ (100 µg/mℓ)



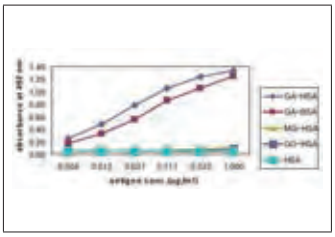
GALPHA(olf) #COP-COP-080058
IHC result for Myoepithelial cell layers of Vomeronasal nerve from *Bufo japonicus formosus* stained with Anti GO monoclonal.



GALPHA(olf) #COP-COP-080058
IHC result for Myoepithelial cell layers of Vomeronasal nerve from *Bufo japonicus formosus* stained with COP-COP-080058.



GALPHA(olf) #COP-COP-080058
IHC result for Myoepithelial cell layers of Vomeronasal nerve from *Bufo japonicus formosus* stained with Merge.



GA-pyridine (LDL) #CAC-AGE-M03
Immunoreactivity of the GA-pyridine (2A2) monoclonal antibody to GA-HAS, GA-BSA, MG-HAS, GO-HSA and HAS.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
Gastric Mucin	Monoclonal HGM505	MS/IgG1 κ	HU	IHC(p)/ELISA	–	KAN-02111-96-EX	50 µℓ (100 µg/mℓ)

Immunohistochemistry
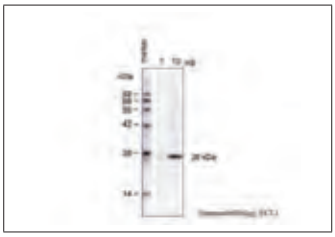
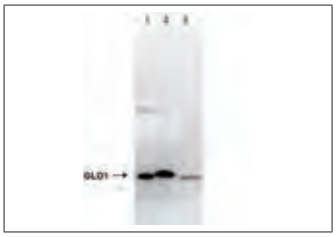
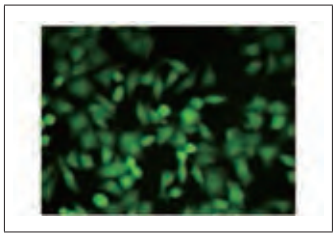
Left: WT mouse ES cell (Positive)
Right: GLP KO mouse ES cell (Negative)



Glutathione S transferase
#COP-COP-080015
Antibody to GST (glutathione S transferase, 212 aa)
Antiserum dilution: 1/1000
Protein sample: *A. thaliana*, crude membrane fraction



Glyoxalase I #BAM-74-001-EX
Detection of GLO1 protein by Western blotting with antibody 6F10.
Samples are whole cell extracts. Mouse GLO1 shows a single band of 27 kDa while human and simian ones show 29 kDa.



Glyoxalase I (GLO1) #BAM-74-001-EX
Immunofluorescent staining of HeLa cells with antibody 6F10.

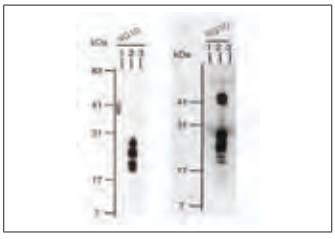
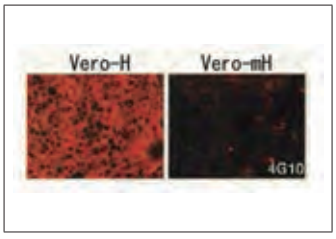
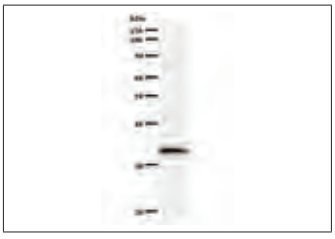
HAO1 ((hydroxyacid oxidase (glycolate oxidase) 1)) #CAC-CNP-HAO1-282
Western blot analysis of HAO1 expression in transfected 293T cell line by HAO1 rabbit polyclonal antibody.



HB-EGF #BAM-71-501-EX
Western blotting. Samples 1. Vero cell extract. 2. Vero cells carrrying human HB-EGF expression vector. 3. Vero cells carrying mouse HB-EGF expression vector.



HB-EGF #BAM-71-501-EX
Immuno-cytochemistry: Samples; (Vero-H) Vero cells carrying human HG-EGF expression vector. (Vero-mH) Vero cells carrying mouse HB-EGF expression vector. Cells treated with antibody 4G10, fixed with 4% PFA and reacted with Cys3 conjugated 2nd antibody.



HCCA2 #CBX-CBX00603
Western blot analysis of immunized recombinant protein, using anti-HCCA2 monoclonal antibody.

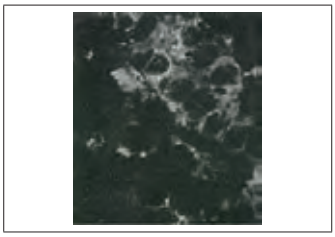
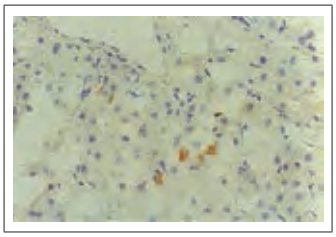
HCV Core protein #BAM-65-053-EX
Western blotting of HCV core protein.



HCV Core protein #BAM-65-053-EX
Detection of HCV core protein by immuno-fluorescence antibody staining.



HCV Core protein #BAM-65-053-EX
Immunohistochemical detection of HCV core protein.

HCV NS4a protein #BAM-65-056-EX
Western blotting of HCV NS4A protein.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
HDAC4	Polyclonal	RAB	HU	WB	–	PRX-KA0288GNP	100 µℓ
HDAC5	Polyclonal	RAB/IgG	MS	WB	–	PRX-MKA0600AF	50 µg
HDAC9 (Histone Deacetylase 9)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-HDAC9-532	100 µℓ
HDGF (Hepatoma-Derived Growth Factor (high-mobility group protein 1-like))	Monoclonal 26C4a	MS/IgG1	HU/MS/RAT	WB/DB	–	CBX-CBX00572	100 µg
HD (Huntingtin (Huntington Disease))	Monoclonal 2401C1a	MS/IgG2b	HU	WB/DB/IC	–	CBX-CBX00628	100 µg
HDLBP (High Density Lipoprotein Binding Protein (vigilin))	Monoclonal 2404C3a	MS/IgG1	HU/MS/RAT	WB/IC/DB	–	CBX-CBX00587	100 µg
HAND2 (Heart and Neural Crest Derivatives expressed 2)	Monoclonal HAND2C1a	MS/IgG1	HU	DB/WB	–	CBX-CBX00651	100 µg
HEL308 (DNA helicase HEL308)	Monoclonal 2406C1a	MS/IgG1	HU/MS/RAT	WB/DB	–	CBX-CBX00560	100 µg
Helicobacter pylori	Monoclonal 3F7	MS/IgG1 κ	*Helicobacter pylori*	ELISA	–	LNM-KR-048	0.1 mg
	Monoclonal 84C7	MS/IgG1 κ	*Helicobacter pylori*	ELISA	–	LNM-KR-049	0.1 mg
HEMK1 (HemK Methyltransferase family member 1)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-HEMK1-299	100 µℓ
Hemoglobin	Monoclonal SU-104	MS/IgG1	HU	ELISA	–	NBT-MSU-104	1 mg
	Monoclonal SU-107	MS/IgG1	HU	ELISA	–	NBT-MSU-107	1 mg

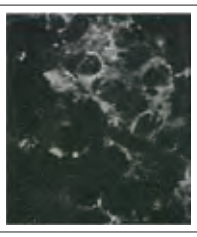
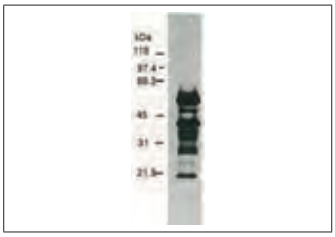
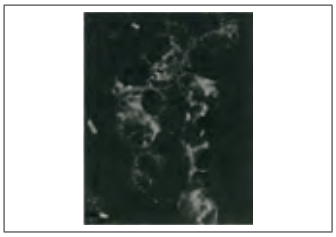
	Monoclonal 5B6	RAT/IgG2a	MS	ELISA	–	YMS-7575	200 µg
	Monoclonal 7A7	RAT/IgG2a κ	MS	–	HRP	YMS-7971	200 µℓ (200 µg /200 µℓ)
Hexanoyl-Lys(HEL), (N ε hexanoyl-Keyhole limpet hemocyanin)	Monoclonal 5F12	MS/IgG	HU	IHC(p)	–	NNS-MHL-021P-EX	20 µg
Hexestrol	Polyclonal	RAB	–	EIA	–	FKA-604-E	2000 test
HEXIM1 (Hexamethylene bis-acetamide inducible 1)	Monoclonal 2416C2a	MS/IgG1	HU	WB/IC/DB	–	CBX-CBX00595	100 µg
HEYL (Hairy/enhancer-of-split related with YRPW motif-like)	Monoclonal 3555C3a	MS/IgG1	HU	WB/DB	–	CBX-CBX00538	100 µg
HFE2 (Hemochromatosis type 2 (juvenile))	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-HFE2-596	100 µℓ
HGF (α-chain)	Monoclonal T6912	MS/IgG1	HU	WB/ELISA	–	SIM-2ZCKHH1	0.5 mℓ (0.25 mg /0.5 mℓ)
	Monoclonal T6942	MS/IgG1	RAT	WB/ELISA	–	SIM-2ZCKRH1	0.5 mℓ (0.25 mg /0.5 mℓ)
HGF (β-chain)	Monoclonal T7156	MS/IgG1	HU	WB/ELISA/IP	–	SIM-2ZCKHH3	0.5 mℓ (0.25 mg /0.5 mℓ)
HGF (reducted α-chain)	Monoclonal K3121	MS/IgG1	HU	WB/ELISA	–	SIM-2ZCKHH2	0.5 mℓ (0.25 mg /0.5 mℓ)
HHEX (Homeobox, Hematopoietically expressed)	Monoclonal HHE5I261	MS/IgG1	HU	WB/ELISA	–	CBX-CBX00224	100 µg
HHV-6	Monoclonal 119	MS	*Herpesvirus*	WB/IF/IC/ELISA/FC/IP	–	BAM-65-200EX	100 µg
HIBADH (3-hydroxyisobutyrate dehydrogenase)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-HIBADH-271	100 µℓ



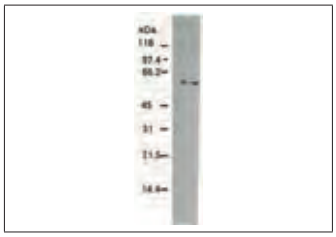
HCV NS4a protein #BAM-65-056-EX
Detection of HCV NS4a protein by immuno-fluorescence antibody staining.



HCV NS5a protein #BAM-65-061-EX
Western blotting of HCV NS5a protein.



HCV NS5a protein #BAM-65-061-EX
Detection of HCV NS5a protein by immuno-fluorescence antibody staining.



HCV NS5b protein #BAM-65-066-EX
Western blotting of HCV NS5b protein.

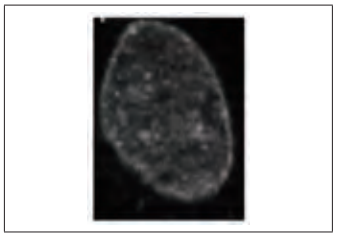
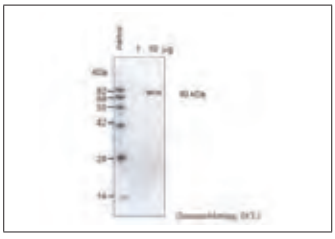
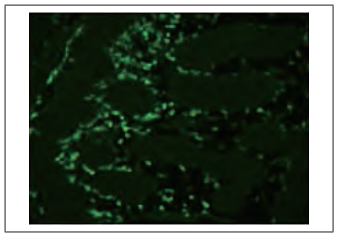
HTATIP2 (HIV-1 Tat Interactive Protein 2)	Monoclonal 422D2a	MS/IgG1	HU	WB/DB	–	CBX-CBX00789	100 μg
HTATIP (HIV-1 Tat interacting protein)	Monoclonal 2455C3a	MS/IgG1	HU	WB/DB/IC	–	CBX-CBX00533	100 μg
	Monoclonal 3557C4a	MS/IgG1	HU	WB/DB/IC	–	CBX-CBX00567	100 μg
HTR2B (5-Hydroxytryptamine (Serotonin) Receptor 2B)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-HTR2B-566	100 μℓ
Human Helix-loop-helix Zipper Protein (MAX)	Monoclonal 73C5a	MS/IgG2b	HU	WB/DB	–	CBX-CBX00526	100 μg



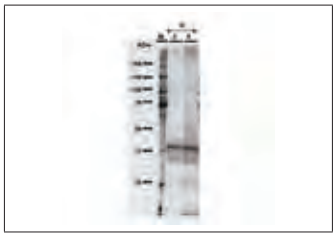
HP1 γ /CBX3 #BAM-70-225-EX
Immunofluorescent staining of HP1 γ in Baby Hamster Kidney cells with this antibody.



HSC70 #COP-COP-080016
Antibody to heat shock cognate protein (HSC70, 651 aa; gene, At5g02500)
Antiserum dilution: 1/500
Protein sample: radish (Raphanus sativa L.Tokinashi-daikon), crude membrane fraction.



Hsd3b #KAL-KO607
Immunofluorescence
Sample: Mouse testis



Hsd3b #KAL-KO607
Western blot: Fetal tissue (testis): 1 μg
C: Anti Mouse 3 β -Hsd Polyclonal antibody.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
Humanin	Polyclonal	RAB/IgG	HU	WB	–	KAL-KR050	25 μg

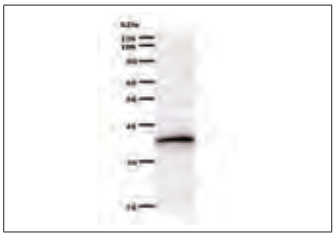
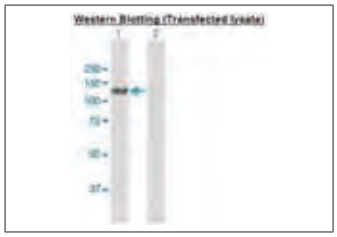
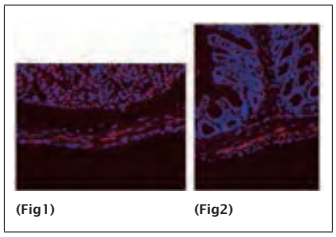
HTATIP2 (HIV-1 Tat interactive protein 2) #CBX-CBX00789
Western blot analysis of immunized recombinant protein, using anti-HTATIP2 monoclonal antibody.



HTATIP (HIV-1 Tat interacting protein, 60kDa, transcript variant 1, mRNA) #CBX-CBX00533
Western blot analysis of immunized recombinant protein, using anti-HTATIP monoclonal antibody.



IARS (Isoleucyl-tRNA Synthetase) #CAC-CNP-IARS-495
Western blot analysis of IARS expression in transfected 293T cell line by IARS rabbit polyclonal antibody.



ICC (Cajal) #COP-COP-080052
IHC profile with Anti ICC monoclonal of Mouse stomach (Fig1) and Mouse Colon (Fig2) fixed with 4% paraformaldehyde (2h).

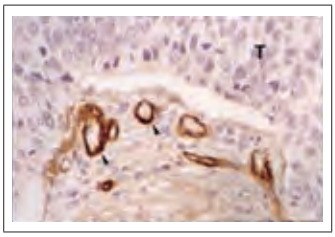
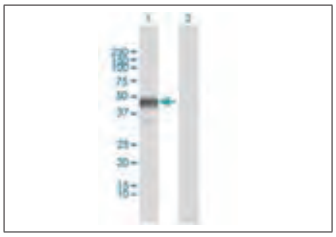
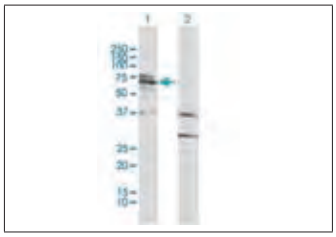
IGFBP-rP1 #CAC-YCU-MK-TF01
Western Blot Analysis for extracted cell culture supernatant of Human Bladder carcinoma Cell Line EJ-1
25kDa : Cleaved form of IGFBP-rP1
33kDa : non- Cleaved form of IGFBP-rP1.



IGFBP-rP1 #CAC-YCU-MK-TF01
Result of Immunohistochemistry for tumor tissue of human Esophagus Cancer (paraffin embedded section).



IGSF4B (Cell Adhesion Molecule 3)
#CAC-CNP-CADM3-136
Western blot analysis of CADM3 expression in transfected 293T cell line by CADM3 rabbit polyclonal antibody. Lane 1: CADM3 transfected lysate (43.30kDa). Lane 2: Non-transfected lysate.



IKZF4 (IKAROS Family Zinc Finger 4)
#CAC-CNP-IKZF4-319
Western blot analysis of IKZF4 transfected 293T cell line by IKZF4 rabbit polyclonal antibody.
Lane 1: IKZF4 transfected lysate (59.70kDa).
Lane 2: Non-transfected lysate.

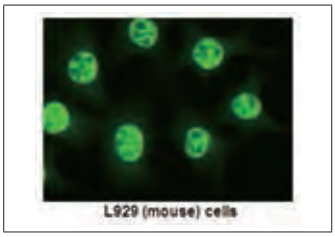
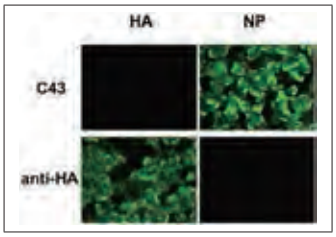
Importin 4 (IPO4) #CAC-CE-005A
Western blot - Importin4 antibody (3C2) L1210 (mouse) cell total extracts.



Importin 4 (IPO4) #CAC-CE-005A
Importin4 antibody (3C2) L929 (mouse) cells.



Influenza A Virus NP #BAM-65-110-EX
IF assay of s93T cells expressing HA or NP of pandemic (H1N1) 2009 influenza A virus.

Influenza A Virus Nucleoprotein #BAM-65-111EX
Western blotting of MDCK cells infected with H1N1 (A/PuertoRico/8/34), H5N1 (A/duck/HK/342/78), or H5N2 (A/crow/Kyoto/53/04) using C43 antibody.

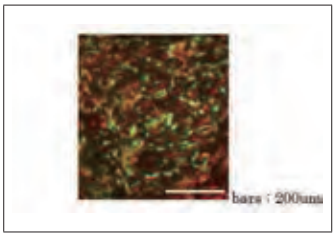
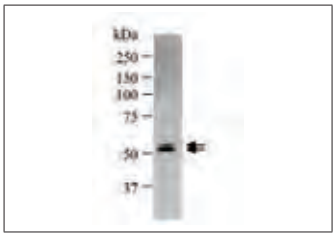
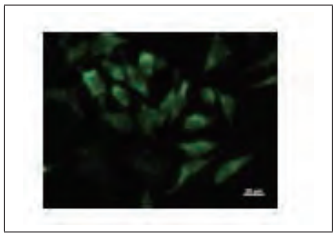
IPMK #CAC-CNP-IPMK-210
Western blot analysis of IPMK expression in transfected 293T cell line by IPMK rabbit polyclonal antibody. Lane 1: IPMK transfected lysate (48.20kDa). Lane 2: Non-transfected lysate.



iPS cell (Tic) #CAC-RIT-M001
Localization of the R-10G and TRA-1-81 epitopes on cultured Tic cells visualized on laser confocal microscopy.



IRF3 (Interferon Regulatory Factor 3)
Detection of human IRF3 by Western blot. Samples: Whole cell lysate (25 µg) from HT1080 cells. [Lot No. IRF35I218-2] Predicted molecular weight: 47 kDa.



IRF3 (Interferon Regulatory Factor 3) #CBX-CBX00167
HeLa cells were fixed in 2% paraformaldehyde/PBS and then permeabilized in 90% methanol. Cells were stained with anti-IRF3 mAb (shaded) or isotype control (unshaded) followed by Alexa Fluor(R) 488-conjugated goat anti-mouse IgG. [Lot No. IRF35I218-2].

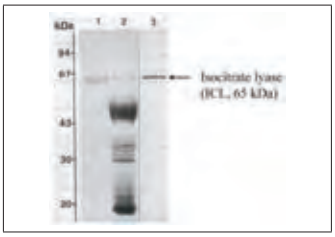
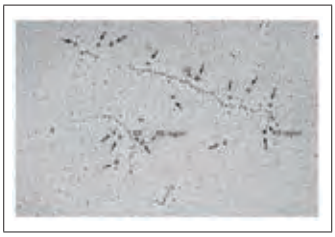
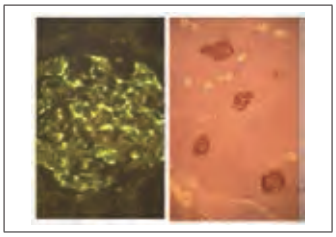
KIAA0556	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0556	100 µℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0556PA	100 µg
KIAA0562	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0562AF	50 µg



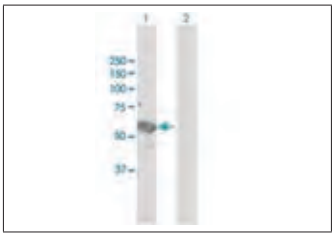
Isocitrate Lyase #COP-COP-080036
SDS-polyacrylamide gel electrophoresis of the purified socitrate lyase (lane 1) and immunoselected protein (lane 2).



Keratan Sulfate #CAC-PRPG-KS-M01
Western blotting of purified human articular cartilage aggrecan resolved prior to and after keratanase II, endo--galactosidase-, or chondroitinase ABC-digestion on SDS-Agarose electrophoresis (left gel) or 3-8% gradient gels.



Keratan Sulfate #CAC-PRPG-KS-M01
Left: IHC staining (FITC-conjugated secondary antibodies) with mAb 373E1 of keratan sulfates of the ECM deposited with a glomerule of human kidney (PFA-OCT embedding and cryosectioning). Right: IHC staining of keratan sulfates deposited within Langerhans islands of human adult pancreas (Formalin-paraffin embedding).



Keratin 12 (Meesmann corneal dystrophy) #CAC-CNP-KRT12-120
Western blot analysis of KRT12 expression in transfected 293T cell line by KRT12 rabbit polyclonal antibody. Lane1: KRT12 transfected lysate (54.34kDa). Lane 2: Non-transfected lysate.

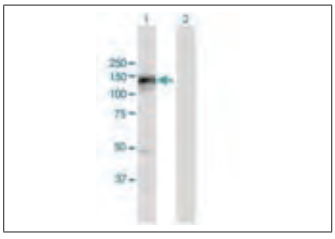
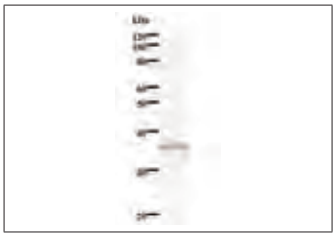
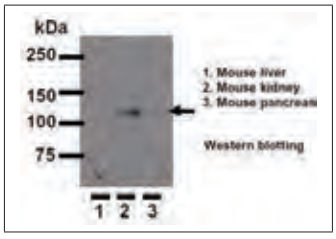
KIAA0863 (ADNP Homeobox 2) #CBX-CBX00790
Western blot analysis of immunized recombinant protein using anti-KIAA0863 monoclonal antibody.



KIAA1199 #CAC-CNP-KIAA1199-208
Western blot analysis of KIAA1199 expression in transfected 293T cell line by KIAA1199 rabbit polyclonal antibody. Lane1: KIAA1199 transfected lysate (110.40kDa). Lane 2: Non-transfected lysate.



KIAA1443 #CBX-CBX00791
Western blot analysis of immunized recombinant protein using anti-KIAA1443 monoclonal antibody.



Klotho #KAL-KO603
Western blotting

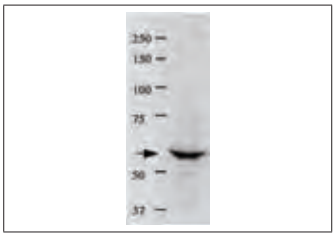
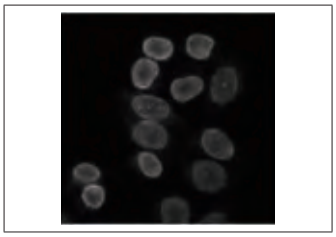
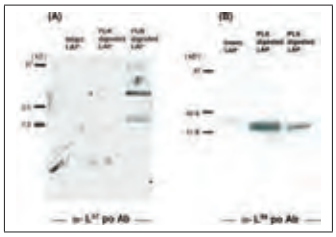
L13, ribosome prot #COP-COP-080014
Antibody to L13 (riobosomal protein L13, 206 aa) Antiserum dilution: 1/1000
Protein sample: A. thaliana, crude membrane fraction.



Lamin B Receptor #BAM-70-301-EX
Identification of LBR in crude extract of HeLa cells by immuno-precipitation followed by Western blotting.



Lamin B Receptor #BAM-70-301-EX
Indirect immuno-fluorescence staining of HeLa cells.



Latent TGF-β (LAP Degradate L57)
#CAC-RIK-CP-PT57
Western Blot. 1/50. Predicted molecular weight: 32 kDa when LAP is cleaved with plasmin.

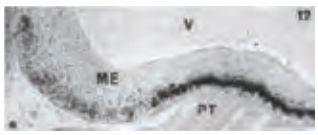
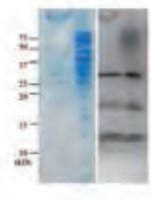
LexA #BAM-61-001-EX
Detection of LexA repressor in the *E. coli* whole cell lysate by this antiserum.



LHRH #CAC-KZ-HS-P02
Chicken Hypothalamus

Ligand-gated ion channel
#COP-COP-080011
Antibody to ligand-gated ion channel (At5g48410, 860 aa)
Antiserum dilution: 1/1000
Protein sample: radish (Raphanus sativus L.), vacuolar membrane.



LT toxin #BAM-64-020EX
Detection LT in culture medium and crude extract of ETEC cells by western blotting, using anti-LT antibody.

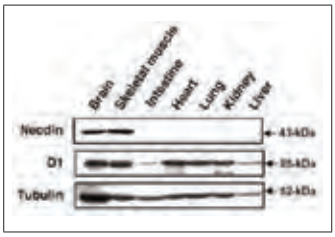
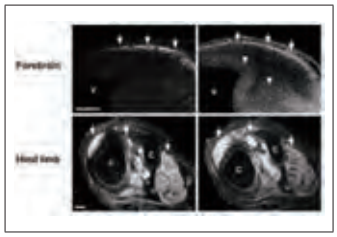
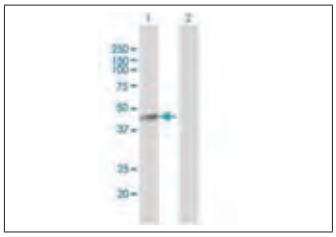
LY6E (Lymphocyte antigen 6 complex, locus E) #CAC-CNP-LY6E-594
Western blot analysis of LY6E expression in transfected 293T cell line by LY6E rabbit polyclonal antibody.



MAGE-D1 #BAM-74-112-EX
Western blot analysis of necdin and MAGE-D1 in mouse embryonal tissues.

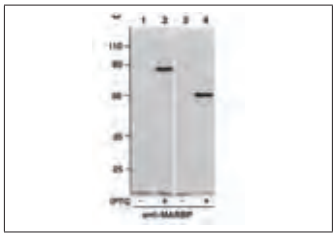


MAGE-D1 #BAM-74-112-EX
Western blot analysis of necdin and MAGE-D1 in mouse embryonal tissues.

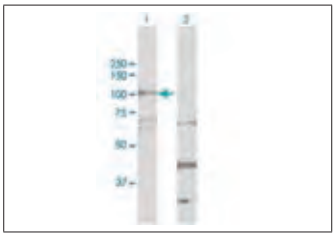


Mannosidase, α, class 1A, member 1 #CAC-CNP-MAN1A1-243
Western blot analysis of MAN1A1 expression in transfected 293T cell line by MAN1A1 rabbit polyclonal antibody. Lane 1: MAN1A1 transfected lysate (40.00kDa). Lane 2: Non-transfected lysate.

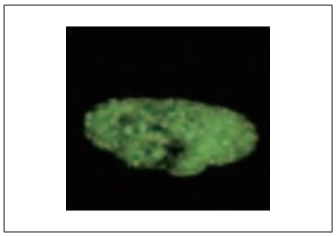
Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
MAP7 (Microtubule-associated protein 7)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-MAP7-375	100 µℓ
MAPK8IP2 (Mitogen-activated protein kinase 8 interacting protein 2)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-MK8IP2-045	100 µℓ
MAPKAPK2 (Mitogen-activated protein kinase-activated protein kinase 2)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-MKAPK2-066	100 µℓ
MAPKAPK3 (Mitogen-activated protein kinase-activated protein kinase 3)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-MKAPK3-061	100 µℓ
MARBP	Polyclonal	RAB/IgG	Plant	WB	–	COP-COP-080053	100 µℓ
MARCKS	Monoclonal MAR11/2	RAT/IgG2a	RAT	WB	–	KAL-KT042	50 µg
MARS (Methionine-tRNA Synthetase)	Monoclonal MARSD10B4	MS/IgG1	HU/MS/RAT	WB/IC/FC/IP/DB	–	CBX-CBX00271	100 µg
Mastermind-like 3 (Drosophila) (MAML3)	Monoclonal 797C2a	MS/IgG1	HU	WB/DB	–	CBX-CBX00458	100 µg
Matrin 3 (MATR3), transcript variant 1	Monoclonal 2539C3a	MS/IgG1	HU/MS/RAT	WB/IC/DB	–	CBX-CBX00486	100 µg
Matrix Gla Protein	Polyclonal	RAB/IgG	MS	IHC	–	KAL-KR083	50 µg
MAX	Polyclonal	RAB	HU	WB	–	PRX-KB3455GNP	100 µℓ
MAX Binding Protein (MNT)	Monoclonal MNTD1C3	MS/IgG1	HU	WB/DB	–	CBX-CBX00306	100 µg
MAX Dimerization Protein 1	Monoclonal MAD1D6H4	MS/IgG2b	HU	WB/DB	–	CBX-CBX00305	100 µg
MAX Gene Associated	Monoclonal MGA6A4H5	MS/IgG1	HU	WB/DB	–	CBX-CBX00269	100 µg
MAZ (MYC-associated zinc finger protein (purine-binding transcription factor))	Monoclonal 75C4a	MS/IgG1	HU	WB/DB	–	CBX-CBX00581	100 µg
MBIP, MAP3K12 Binding Inhibitory Protein 1 (MBIP)	Monoclonal 2543C1a	MS/IgG1	HU	WB/DB	–	CBX-CBX00708	100 µg
MBTPS1	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0091	100 µℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0091PA	100 µg
MCM2	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0030	100 µℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0030PA	100 µg
MCM2 (Minichromosome Maintenance Complex Component 2)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-MCM2-346	100 µℓ
	Monoclonal 2546C1a	MS/IgG1	HU	WB/DB	–	CBX-CBX00646	100 µg
MCM6 (Minichromosome Maintenance Complex Component 6)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-MCM6-347	100 µℓ
MCM7	Polyclonal	RAB	HU/MS/RAT/HAM	WB/IF/IP	–	BAM-70-120EX	100 µg
MCM9 (Minichromosome Maintenance Complex Component 9)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-MCM9-349	100 µℓ
MCM10 (Minichromosome Maintenance Complex Component 10)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-MCM10-348	100 µℓ
MDA	Monoclonal 1F83	MS/IgG2a λ	–	IHC	–	NOF-N213530-EX	30 µg
MDC1, NFBD1, KIAA0170	Polyclonal	RAB/IgG	HU	WB	–	KAL-KR087	25 µg
Mdmx	Monoclonal 15	MS/IgG2b κ	HU/MS	WB/ELISA/IP	–	BAM-71-141-EX	50 µg (1 mg/mℓ)
MECR (Mitochondrial trans-2-enoyl-CoA Reductase)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-MECR-277	100 µℓ
MED24	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0130AF	50 µg
Medaka Vitellogenin	Monoclonal	MS/IgG	Killifish	WB/ELISA	HRP	EBT-MVD33-HRP-EX	0.5 mℓ
MEF	Polyclonal	RAB/IgG	HU	WB	–	KAL-KK053	10 µg
MEF2A	Polyclonal	RAB	HU	WB	–	PRX-KB3473GNP	100 µℓ
MEF2C	Polyclonal	RAB	HU	WB	–	PRX-KB4035GNP	100 µℓ
MEF2D	Polyclonal	RAB/IgG	MS	WB	–	PRX-MKB0022AF	50 µg



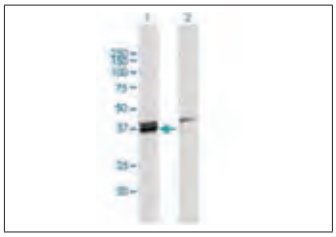
MARBP #COP-COP-080053
Lanes 1 and 2: cell extract of *E. coli* expressing GST-N(MARBP)-His protein (74 kDa).
Lanes 3 and 4: cell extract of *E. coli* expressing GST-C(MARBP)-His protein (50 kDa).



MCM6 (Minichromosome maintenance complex component 6) #CAC-CNP-MCM6-347
Western blot analysis of MCM6 expression in transfected 293T cell line by MCM6 rabbit polyclonal antibody. Lane 1: MCM6 transfected lysate (92.90kDa). Lane 2: Non-transfected lysate.



MCM7 #BAM-70-120EX
Immunofluorecence staining and confocal microscopic analysis of MCM7 in G1 phase HeLa cell nucleus by using anti-MCM7 antibody after treatment with protein cross-linking reagent, DSP and chromatin extraction.



MECR (Mitochondrial trans-2-enoyl-CoA Reductase) #CAC-CNP-MECR-277
Western blot analysis of MECR expression in transfected 293T cell line by MECR rabbit polyclonal antibody. Lane 1: MECR transfected lysate (40.50kDa). Lane 2: Non-transfected lysate.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
MEIS2 (Meis homeobox 2)	Monoclonal 425C2a	MS/IgG2b	HU	DB/WB	–	CBX-CBX00663	100 μg
MESDC2	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0081	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0081PA	100 μg
Mestranol (EE2-methyl ether)	Polyclonal	RAB	–	EIA	–	FKA-610	2000 test
Metallothionein	Monoclonal 1A12	MS/IgG1	HU/MS/RAT/ RAB	WB/IB	–	KAL-KA009	100 μg
	Monoclonal 1A12	MS/IgG1	HU/MS/RAT/ RAB	WB/IB	Biotin	KAL-KA009-01	100 μg
METAP1	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0094	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0094PA	100 μg
Metastin	Polyclonal	RAB/IgG	HU	WB	–	CAC-SK-T01-005	100 μl
Met-Enkephalin-Arg^{6}-Gly^{7}-Leu^{8}	Polyclonal	RAB	HU/RAT/BOV/ CAN/MKY/GP/ FEL	IHC/RIA	–	YII-Y140-EX	50 μl
Methylglyoxal	Monoclonal	MS/IgG2a	–	IHC	–	NOF-N213430-EX	30 μg
METTL13	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0859	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0859PA	100 μg
MEX3B	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA2009	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA2009PA	100 μg

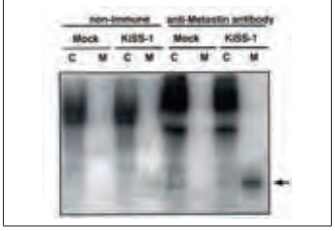
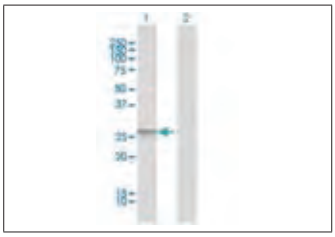
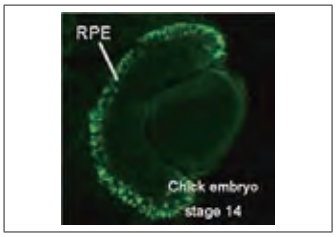
MFN2	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0214	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0214PA	100 μg
MGC4172 (Short-chain Dehydrogenase/ reductase)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-DHRS-403	100 μl
MGC10993 (Transmembrane Protein 177)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-TMEM177-305	100 μl
MGEA5	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0679	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0679PA	100 μg
Mibolerone	Polyclonal	RAB	–	EIA	–	FKA-618	2000 test
MICAL2	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0750AF	50 μg
MICALL1	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA1668	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA1668PA	100 μg
MIS12, MIND Kinetochore Complex Component	Monoclonal 2572C2a	MS/IgG1	HU	WB/DB	–	CBX-CBX00798	100 μg
Mis13 (c20orf172)	Polyclonal	RAB	HU	WB/IF	–	BAM-70-101-EX	100 μl
Mite Der f1	–	–	–	–	–	LSL-LB-7111	100 μl
Mite Extract	Polyclonal	RAB	–	IHC/IF/ELISA/ WB	–	LSL-LB-5199	100 μl
Mite Group 1	–	RAB	–	ELISA/WB/IHC/ IF	–	LSL-LB-7103	100 μl
Mite Group 2	–	RAB	–	ELISA/WB/IHC/ IF	–	LSL-LB-7204	100 μl
MiTF	Polyclonal	RAB	HU/MS	WB/IHC/IC/ChIP	–	BAM-73-107-EX	100 μl
MLEC	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0152	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0152PA	100 μg
MLF1 (Myeloid Leukemia Factor 1)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-MLF1-412	100 μl
MLLT4	Polyclonal	RAB/IgG	HU	WB	–	PRX-KD0114GNPAF	50 μg
MLLT6	Polyclonal	RAB	HU	WB	–	PRX-KB4336GNP	100 μl



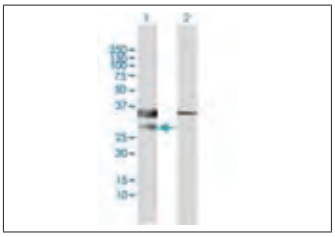
Metastin #CAC-SK-T01-005



MGC10993 (Transmembrane protein 177) #CAC-CNP-TMEM177-305
Western blot analysis of TMEM177 expression in transfected 293T cell line by TMEM177 rabbit polyclonal antibody. Lane 1: TMEM177 transfected lysate (31.02kDa). Lane 2: Non-transfected lysate.



MiTF #BAM-73-107-EX
Immunohistochemical staining of Mitf in chick embryo at stage 14. Embryos were fixed with paraformaldehyde and embedded in OCT compound and sectioned with a cryostat at 8 μm.



MLF1 (Myeloid Leukemia factor 1) #CAC-CNP-MLF1-412
Western blot analysis of MLF1 expression in transfected 293T cell line by MLF1 rabbit polyclonal antibody. Lane 1: MLF1 transfected lysate (30.60kDa). Lane 2: Non-transfected lysate.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size

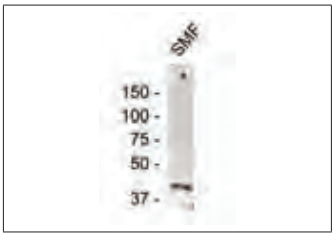
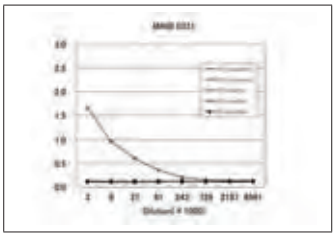
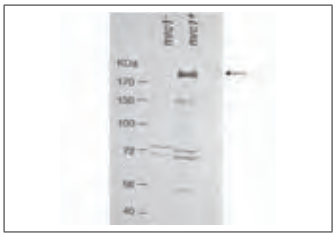
MRPL13	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-MRPL13-563	100 μℓ



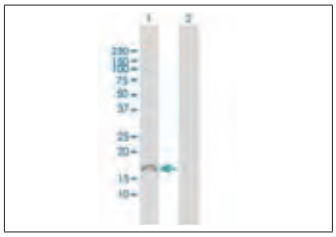
Monocarboxylate Transporter 2 (MCT2)
#CAC-YCU-M-MCT2A
Mouse cerebellum synaptic membrane fraction (SMF) was resolved by electrophoresis, transferred to PVDF and probed with anti-mouse monocarboxylate transporter 2 antibody.



Monomethyl Histone H3 (Lys36)
#MCA-MABI0331-100-EX



Mrc1 #BAM-63-151-EX
Western blot analysis of Mrc1 in the whole cell extracts.
Lane 1: mrc- strain Lane 2: Wild type strain.



MRPL42 #CAC-CNP-MRPL42-396
Western blot analysis of MRPL42 expression in transfected 293T cell line by MRPL42 rabbit polyclonal antibody. Lane 1: MRPL42 transfected lysate (16.70kDa). Lane 2: Non-transfected lysate.

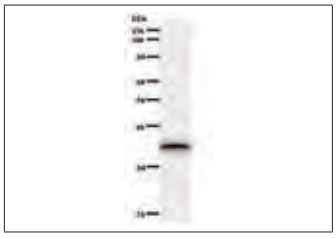
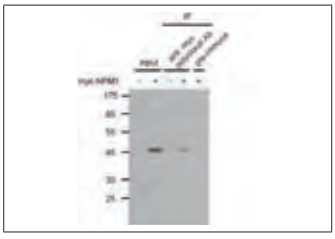
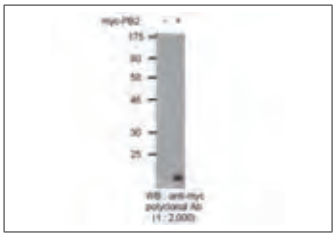
Myoglobin	Monoclonal 1C10	MS/IgG1 κ	HU	ELISA	–	LNM-KR-027	0.1 mg (1 mg/mℓ)
	Monoclonal 5D6	MS/IgG2a κ	HU	ELISA	–	LNM-KR-028	0.1 mg (1 mg/mℓ)



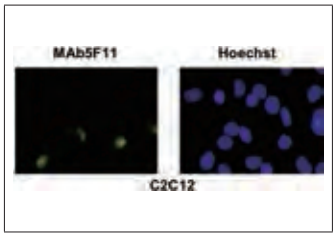
MTA3 #CBX-CBX00542
Western blot analysis of immunized recombinant protein, using anti-MTA3 monoclonal antibody.



Myc tag #BAM-60-041-EX
Detection of Myc-tagged protein with this antibody by Western blotting. (-) Lysate of 293T cells transfected with an empty vector (+) Lysate of 293T cells transfected with the plasmid carrying the Myc-tagged PB2 gene.



Myc tag #BAM-60-041-EX
Immunoprecipitation of Myc-tagged protein with this antibody followed by Western blotting.
-: Lysate of 293T cells transfected with an empty vector
+: Lysate of 293T cells transfected with the plasmid carrying the Myc-tagged NPM1 gene.



MyoD #CAC-CE-011A
Immunocytochemistry/ Immunofluorescence - MyoD antibody (5F11) C2C12 (mouse) cells.

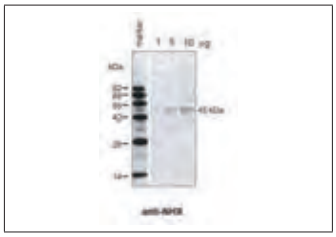
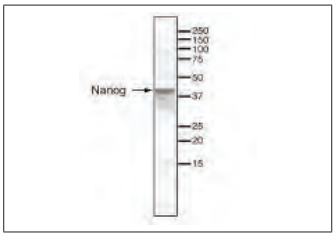
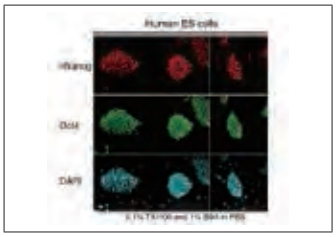
Nanog	Polyclonal	RAB	HU/MS/MKY	WB/IC/IP	–	REC-RCAB0001P	200 μℓ (0.2 mg/mℓ)
	Polyclonal	RAB	HU/MS/MKY	WB/IC/IP	–	REC-RCAB0002P-F	100 μℓ (0.2 mg/mℓ)
	Polyclonal	RAB	HU	WB/IC	–	REC-RCAB0003P	200 μℓ (0.2 mg/mℓ)
	Polyclonal	RAB	HU	WB/IC	–	REC-RCAB0004P-F	100 μℓ (0.2 mg/mℓ)
NAP1L1	Monoclonal 2609C3a	MS/IgG1	HU/MS/RAT	WB/DB	–	CBX-CBX00592	100 μg
NAP1L2	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-NAP1L2-309	100 μℓ
NAP1L3	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-NAP1L3-497	100 μℓ
NAPE-PLD	Polyclonal	RAB	HU/MS/RAT	WB/IHC/IF	–	BCN-BCN4793	0.1 mℓ



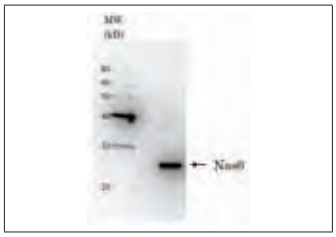
Na+/H+ antiporter #COP-COP-080020
Antibody to Na+/H+ exchanger (NHX, 538 aa, AF106324) Radish (Raphanus sativus L.) taproot crude membrane fraction.



Nanog #REC-RCAB0001P

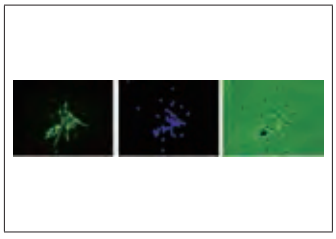


Nanog #REC-RCAB0003P

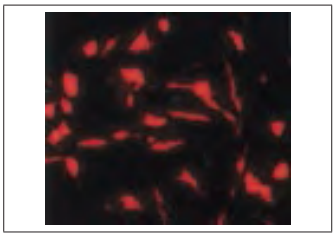


Nas6 #BAM-62-213-EX
Detection of Nas6 in the crude extract of S. cerevisiae by western blotting.

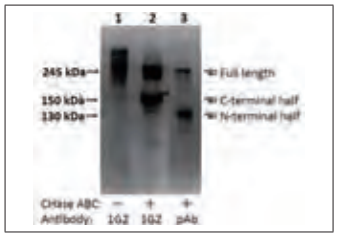
Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
NARS (Asparaginyl-tRNA synthetase)	Monoclonal NARS2G5	MS/IgG1	HU/MS	WB/IC/IP/DB	–	CBX-CBX00228	100 µg
Nas6	Polyclonal	RAB	*Saccharomyces cerevisiae*	WB/IP	–	BAM-62-213-EX	100 µℓ
Nascent Polypeptide-associated Complex α Subunit	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-NACA-182	100 µℓ
NAV3	Polyclonal	RAB/IgG	MS	WB	–	PRX-MKA0938AF	50 µg
NBR1	Polyclonal	RAB	MS	WB	–	PRX-MKA0049PA	100 µg
NBS1	Polyclonal	RAB	HU	WB	–	BCN-BCN4781	50 µℓ
NCALD	Polyclonal	RAB	HU	WB	–	PRX-KE0169GNP	100 µℓ
	Polyclonal	RAB/IgG	HU	WB	–	PRX-KE0169GNPAF	50 µg
NCAPH	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0074	100 µℓ
NCDN	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0607	100 µℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0607PA	100 µg
NCKAP1	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0587	100 µℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0587PA	100 µg
NCK Interacting Protein with SH3 Domain	Monoclonal 2614C1a	MS/IgG1	HU	WB/DB	–	CBX-CBX00591	100 µg
NCOR2	Polyclonal	RAB/IgG	HU	WB	–	PRX-KD0137GNPAF	50 µg
NDRG2	Polyclonal	RAB/IgG	MS	WB	–	PRX-MKA1248AF	50 µg
NDRG4	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA1180	100 µℓ
Necdin	Polyclonal NC243	RAB	HU/MS/RAT	WB/IHC/IC	–	BAM-74-100-EX	100 µℓ
NEIL3 (Nei Endonuclease VIII-like 3 (*E. coli*))	Monoclonal 2627C1b	MS/IgG1	HU	WB/DB	–	CBX-CBX00571	100 µg
NEIL2 (Nei-like 2 (*E. coli*))	Monoclonal 2626C2a	MS/IgG1	HU/MS/RAT	WB/DB	–	CBX-CBX00604	100 µg
Nephritis-associated Plasmin Receptor	Monoclonal 1F10	MS/IgG2a κ	–	–	FITC	YMS-80041	200 µℓ (200 µg/200 µℓ)
Nestin	Monoclonal 7A3	RAT/IgG2b κ	MS	IHC/IC	–	BAM-73-100EX	100 µg
	Polyclonal	RAB	MS/RAT	WB/IHC/IC	–	BAM-73-105-EX	100 µℓ
NEURL4	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA1787	100 µℓ
Neurocan	Monoclonal 1G2	MS/IgG1 κ	RAT	WB/ELISA/IP/ IHC(f)/IHC(p)	–	CAC-NU-07-002	200 µℓ (1 mg/mℓ)
Neurocan Peptides	Polyclonal	RAB	MS/RAT	WB/IHC(p)	–	CAC-NU-07-005	200 µℓ
NET1 (Neuroepithelial Cell Transforming Gene 1)	Monoclonal 2633C5a	MS/IgG1	HU	WB/DB	–	CBX-CBX00455	100 µg
Neuroglycan C	Monoclonal C1	MS/IgG1 λ	RAT	WB/IP/IHC(f)/ IHC(p)	–	CAC-NU-07-003	200 µℓ (1 mg/mℓ)
Neurotensin	Polyclonal	RAB	HU/RAT/BOV/ MKY	IHC/RIA	–	YII-Y130-EX	50 µℓ
NFIA	Polyclonal	RAB/IgG	MS	WB	–	PRX-MKA1439AF	50 µg
	Monoclonal 438C1a	MS/IgG1	HU	DB/WB	–	CBX-CBX00664	100 µg
NFKB2 (Nuclear factor of κ light polypeptide gene enhancer in B-cells 2)	Monoclonal 444C3a	MS/IgG1	HU	DB/WB	–	CBX-CBX00656	100 µg
NFKBIB	Polyclonal	RAB	HU	WB	–	PRX-KB6482GNP	100 µℓ
NFKBIB (Nuclear factor of κ light polypeptide gene enhancer in B-cells inhibitor)	Monoclonal IKB5I328	MS/IgG1	HU	WB/ELISA	–	CBX-CBX00200	100 µg
NFKBIL2 (Nuclear factor of κ light polypeptide gene enhancer in B-cells inhibitor-like 2)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-NFKBIL2-329	100 µℓ
NFRKB	Polyclonal	RAB/IgG	HU	WB	–	PRX-KD0093GNPAF	50 µg
NFRKB (Nuclear Factor related to kappaB Binding Protein)	Monoclonal 445C4a	MS/IgG1	HU	WB/DB/IC	–	CBX-CBX00531	100 µg



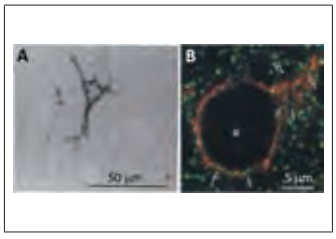
Nestin #BAM-73-100EX
Primary culture of neural progenitor cells from mouse fetal brain stained with 7A3 (Left), stained with Hoechst (Center), and without staing (Right).



Nestin #BAM-73-105-EX
Detection of Nestin in whole extracts of mouse neocortex and neural stem cells by western blotting with anti-Nestin antibody (ST1).



Neurocan #CAC-NU-07-002
Characterization of neurocan peptide pAb and neurocan mAb (clone 1G2) with samples obtained from 10-day-old rat brain.



Neurocan peptides #CAC-NU-07-005
Distribution of neurocan in the adult rat cerebral cortex.

NF-

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
NFS1 (Nitrogen fixation 1 homolog (*S. cerevisiae*))	Monoclonal 2635E1a	MS/IgG1	HU/MS/RAT	WB/DB	–	CBX-CBX00583	100 μg
NFYB (Nuclear transcription factor Y, β)	Monoclonal NFYBA7	MS/IgG1	HU	WB/DB/IC	–	CBX-CBX00280	100 μg
NGFI-A Binding Protein 1 (EGR1 Binding Protein 1)	Monoclonal 2607C2a	MS/IgG1	HU/RAT	WB/IC/DB	–	CBX-CBX00620	100 μg
NGFI-A Binding Protein 2 (EGR1 Binding Protein 2)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-NAB2-496	100 μℓ
NGFI-B α	Monoclonal H1648	MS/IgG2a	HU	WB/ELISA/IP	–	PPX-PP-H1648-00	0.1 mℓ (1 mg/mℓ)

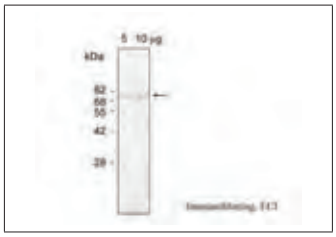
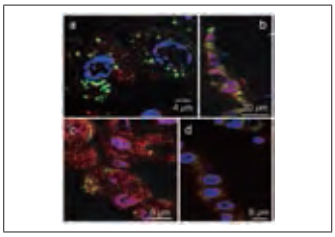
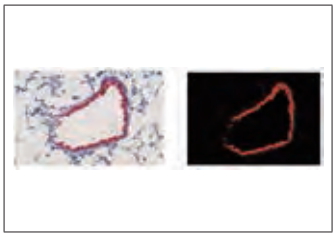
NOD2	Polyclonal	RAB/IgG	POR	WB/IHC/FC	–	CAC-THU-A-NOD2	50 μℓ
	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-NOD2-038	100 μℓ
N ω -(carboxymethyl) Arginine	Monoclonal 3F5	MS/IgG1	–	WB/IHC/ELISA	–	CAC-AGE-M04	100 μℓ
Non-metastatic cells 5, protein expressed in (nucleoside-diphosphate kinase)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-NME5-260	100 μℓ
Norgesterol	Polyclonal	RAB	–	EIA	–	FKA-622	2000 test
NOSII(77-105)	Polyclonal	RAB	RAT	IHC(f)/RIA	–	YII-YP051-EX	50 μℓ
NPAT (Nuclear protein, ataxia-telangiectasia locus)	Monoclonal 2648C6a	MS/IgG1	HU	DB/WB	–	CBX-CBX00653	100 μg
NPEPPS (Aminopeptidase Puromycin Sensitive)	Monoclonal 2649C4a	MS/IgG2a	HU	WB/DB	–	CBX-CBX00724	100 μg
NPHP4	Polyclonal	RAB/IgG	MS	WB	–	PRX-MKA0673AF	50 μg
NPLOC4	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA1499	100 μℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA1499PA	100 μg



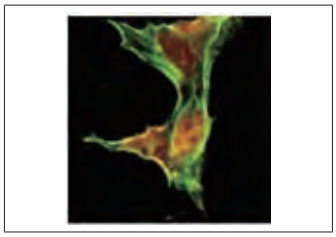
Nitrate transporter (AJ011604)
#COP-COP-080009
Antibody: anti-(nitrate transporter, AJ011604, 577 aa) Antiserum dilution: 1/1000 Protein sample: radish (Raphanus sativus L.) vacuolar membrane.



Nitroguanosine #CAC-KMU-M01
Production of 8-nitroguanine by airway epithelial cell with Idiopathic Fibrosis (IPS).



Nitroguanosine #CAC-KMU-P01
Immunostaining example of influenza virus-infected mouse lung epithelial cell.



NOD1 #CAC-THU-A-NOD1
Immunofluorescence staining of NOD1 in Porcine NOD1-expressing HEK293 cells with anti Porcine NOD1 antibody.

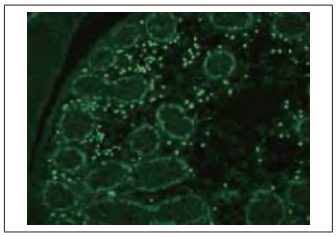
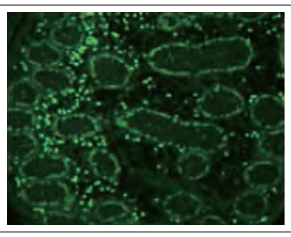
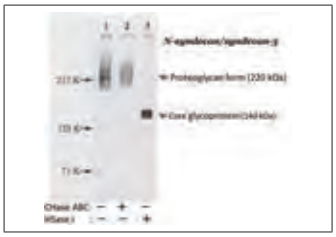
Nucleobindin 2	Polyclonal	RAB	HU/MS/RAT	WB/IHC/IC/ChIP	–	BAM-73-109-EX	100 µℓ
NUDT5 (Nudix (Nucleoside Diphosphate Linked Moiety X)-type Motif 5)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-NUDT5-600	100 µℓ



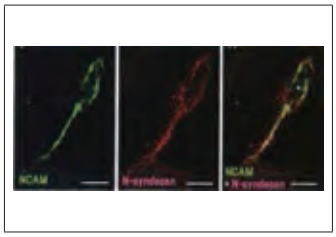
Nr5a1 #KAL-KO610
IF sample: mouse testis



NR5A1 #KAL-KO611
IF sample: mouse testis



N-syndecan #CAC-NU-07-004
Characterization of the polyclonal anti-N-syndecan antiserum.



N-syndecan #CAC-NU-07-004
Comparative localization of immunoreactivity for N-syndecan in the developing rat (16days) vomeronasal system.

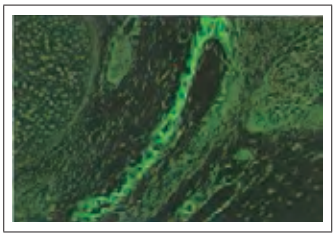
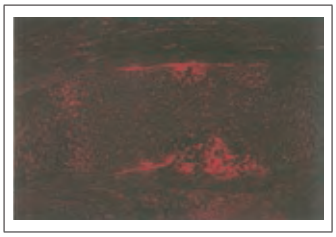
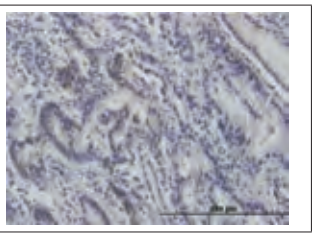
OsPIP1;3 #COP-COP-080040
Yeast cells expressing each isoform.



Osteocalcin #LSL-LB-4005
HTC-immunofluorescent staining of vivipary 16 days Rat mandibular (4% formalin).



Osteopontin #LSL-LB-4225
Rodamine-Immunofluorescent staining of vivipary 18 days Rat lower limb (4% formalin).



p53 #BAM-71-115-EX
Kinetics of phosphorylation of p53 at Ser46 after UV-irradiation.
Samples of MCF7 cells (human beast cancer cell line) were taken at the indicated times after UV-irradiation at 20 J/㎡ and analyzed by western blotting with anti-p53 p-S46 antibody (#36) and anti-p53 antibody (non BioAcademia).

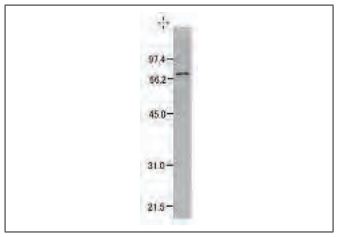
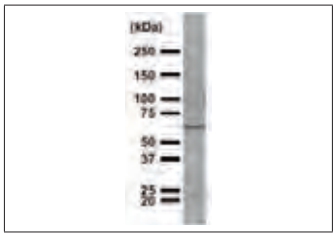
Pad #BAM-63-133-EX
Fractions from sucrose gradient centrifugation of wild type S. pombe cells containing integrated Cut8-3HA were immunoblotted using antibodies Nuc2, Pad1 and HA.

PAD 2 #SML-ROI002-EX
Hippocampus of Alzheimer's Disease stained with PAD2 antibody (ROI002) at 1:300 dilution and developed by 3,3' diaminobenzidine. Dentate gyrus and stratum radiatum of CA1 and CA2 areas stained.



PAD 2 #SML-ROI002-EX
Western blot analysis. Lane : Human brain tissue extract. PAD2 antibody (ROI002) at 1:1,000 dilution used.



PAG #KAL-KO579
Western blot analysis. Rat brain lysate.

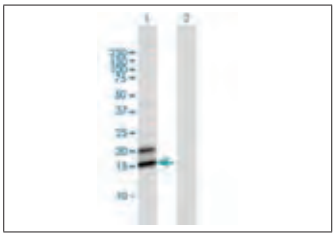
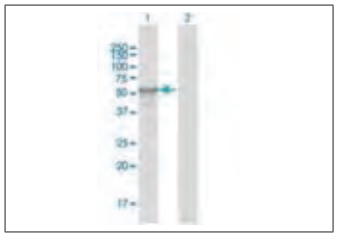
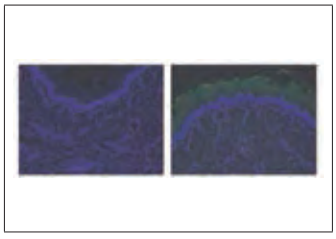
Pertussis Toxin #BAM-64-030EX
Detection of perussis toxin in culture medium of Bordetera pertussis strain Tohama by Western blotting using anti-perussis toxin antibody.



PFDN4 (Prefoldin subunit 4)
#CAC-CNP-PFDN4-382
Western blot analysis of PFDN4 expression in transfected 293T cell line by PFDN4 rabbit polyclonal antibody. Lane 1: PFDN4 transfected lysate (15.30kDa). Lane 2: Non-transfected lysate.



PFKFB1 (6-phosphofructo-2-kinase/ fructose-2,6-biphosphatase 1)
#CAC-CNP-PFKFB1-270
Western blot analysis of PFKFB1 expression in transfected 293T cell line by PFKFB1 rabbit polyclonal antibody. Lane 1: PFKFB1 transfected lysate (54.70kDa). Lane 2: Non-transfected lysate.



PGLYRP3 #COP-COP-080060
Immunohistochemical staining in the longitudinal section of porcine esophagus with anti-porcine PGLYRP3 antisera [Cat#COP-080060] (green).

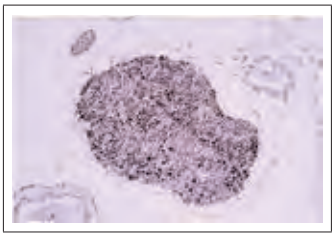
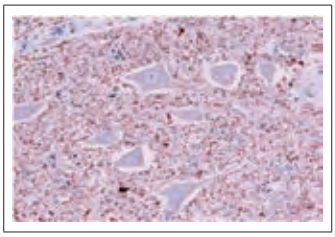
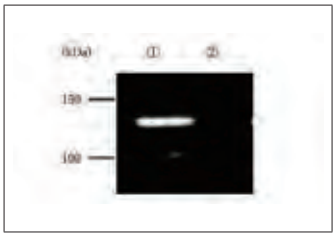
PLEKHM1	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0356	100 µℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0356PA	100 µg
PLK3 (Polo-like Kinase 3 (*Drosophila*))	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-PLK3-324	100 µℓ
PLOD2 (Procollagen-lysine, 2-oxoglutarate 5-dioxygenase 2)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-PLOD2-021	100 µℓ
Plumbagin	Monoclonal 3A3	MS/IgG1 κ	–	ELISA	–	CAC-KYU-HT-M005	100 µℓ
PLXNB1	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0407	100 µℓ



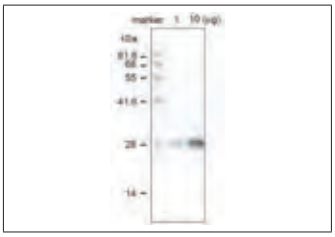
Phospho-Neurofilament H M
#CAC-GU01-M02AS-A
Result of Immunohistochemistry with NFP-1D for Posterior Root of Human Spinal Nerve.



Phospho-Neurofilament H M
#CAC-GU01-M02AS-A
Result of Immunohistochemistry with NFP-1D for Anterior Root of Human Spinal Cord.



Phototropin 1 #KAL-KR095
Western Blotting. Sample: Arabdopsis leaves. Lane 1: Wild type. Lane 2: Deletion Mutant for phot1/phot2.



PIP2;7 #COP-COP-080005
Antibody: anti-(PIP2;7 or PIP3a) Protein sample: A. thaliana, crude membrane fraction.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size

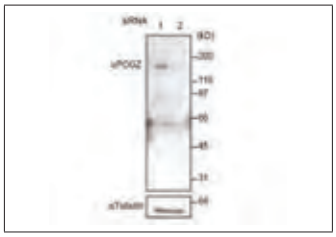
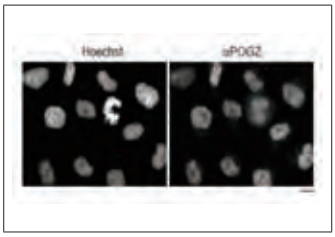
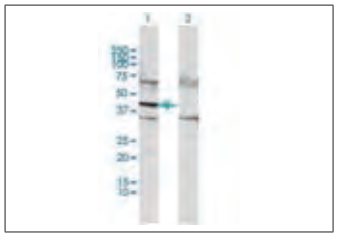
	Monoclonal	MS	MS	WB	–	CAC-ABN-M03-MP	100 μg



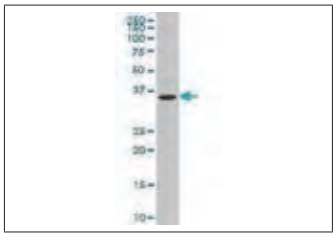
POGZ #BAM-70-112-EX
Western blot of POGZ. Lane 1: Crude extract of HeLa cells transfected with control siRNA. Lane 2: Crude extract of HeLa cells transfected with POGZ specific siRNA.



POGZ #BAM-70-112-EX
Western blot of POGZ. Lane 1: Crude extract of HeLa cells transfected with control siRNA Lane 2: Crude extract of HeLa cells transfected with POGZ siRNA The antibody was used at 1/1,000.



Polymerase (DNA directed), ε
#CAC-CNP-POLE-240
Western blot analysis of POLE expression in transfected 293T cell line by POLE rabbit polyclonal antibody. Lane 1: POLE transfected lysate (41.50kDa). Lane 2: Non-transfected lysate.



PON1 #CAC-ABN-M02-HP
Primary antibody: Anti human PON1 monoclonal. Antibody (×1,000)
Secondary antibody: Goat anti-mouse IgG-HRP (×2,500).

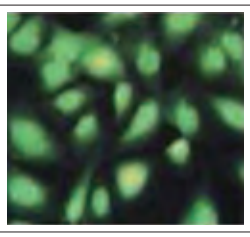
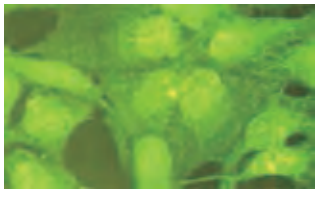
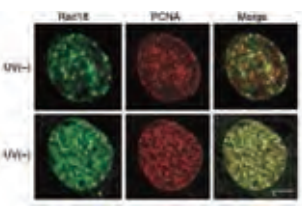
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0665PA	100 μg
RAB11FIP5	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0857	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0857PA	100 μg
RAB13, member RAS oncogene family	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-RAB13-013	100 μl
RAB27B, member RAS oncogene family	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-RAB27B-330	100 μl
RAB37, member RAS oncogene family	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-RAB37-192	100 μl
RABGAP1L	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0471	100 μl
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0471PA	100 μg
RAD1 homolog (*S. pombe*)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-RAD1-502	100 μl
Rad6	Polyclonal	RAB	HU/MS/RAT/HAM	WB/IF/IP	–	BAM-70-020-EX	100 μg
Rad18	Polyclonal	RAB	HU	WB/IF/IP	–	BAM-70-023-EX	100 μg
	Polyclonal	RAB	MS	WB/IHC/IF/IP	–	BAM-70-025-EX	100 μg
Rad21	Polyclonal	RAB	*Schizosaccharomyces pombe*	WB	–	BAM-63-139-EX	50 μl
	Polyclonal	RAB	HU/MS/HAM	WB/IF	–	BAM-70-105EX	50 μg
Rad22/Rad52	Polyclonal	RAB	*Schizosaccharomyces pombe*	WB/ELISA/IP/IF	–	BAM-63-003-EX	50 μg
RAD23B (P58, HR23B, HHR23B,RAD23 homolog B)	Monoclonal 2857D7a	MS/IgG1	HU	WB/DB	–	CBX-CBX00678	100 μg



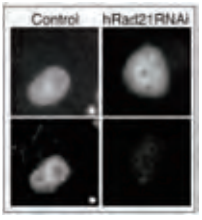
Rad6
#BAM-70-020-EX
Western blot analysis of Rad6 in the whole cell extracts of HeLa cell (10 mg) with anti-Rad6.



Rad18
#BAM-70-023-EX
Indirect immunofluorescence staining of Rad18 protein in GM637 cells. Rad18 protein is stained as yellow dots in nuclei.



Rad18
#BAM-70-023-EX
Identification of Rad18 protein in crude extract of A549 cells by Western blotting. The lower thick band is native Rad18 and the upper thin band is mono-ubiquitinated Rad18 protein.



Rad21
#BAM-70-105EX
Immunofluorescence staining of Rad21.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size

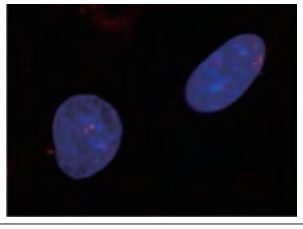
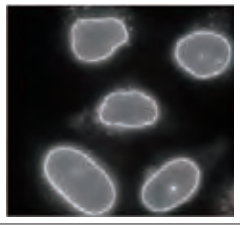
RAR β	Monoclonal H4338	MS/IgG2a	HU	WB/ELISA/IP	–	PPX-PP-H4338-00	0.1 mℓ (1 mg/mℓ)
RAR γ	Monoclonal H5620	MS/IgG2a	HU	WB/ELISA/IP	–	PPX-PP-H5620-00	0.1 mℓ (1 mg/mℓ)

Rad51
#BAM-62-102-EX
Western blotting of the crude cell extract of S. cerevisiae wild-type strain (left lane) and Rad51 deletion mutant (right lane) using this antibody.



Rad51
#BAM-70-002-EX
Detection of Rad51 foc: formation induced by DNA damage.

Rad51
#BAM-70-009EX
SDS-PAGE (without Et-SH) analysis of purified IgY.



RanBP2
#BAM-71-004-EX
Para formaldehyde fixed HeLa cells stained with a anti RanBP2 cDNA.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size

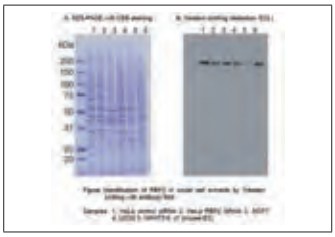
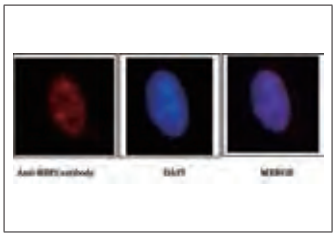
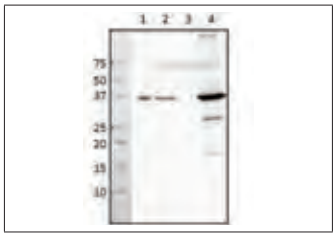
RB
#BAM-71-171-EX
Specificity of the monoclonal antibody (28B5) to the phosphorylated Rb at Ser795 as demonstrated by Western blotting.



RBP2/JARID1A
#BAM-71-175-EX
Identification of RBP2 in crude cell extracts by Western blotting with antibody 9A6.



RBP2/JARID1A
#BAM-71-177-EX
Immunofluorescence staining of HeLa cell with anti-RBP" antibody.



RecA
#BAM-61-003-EX
Western blot analysis of RecA protein in crude extract of *E. coli*.

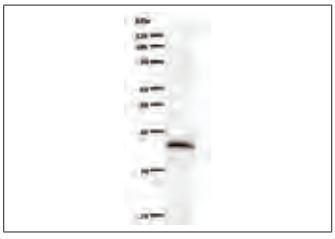
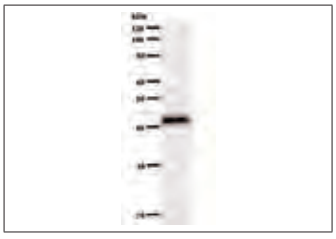
RNF31	Polyclonal	RAB/IgG	MS	WB	–	PRX-MFL0217AF	50 µg

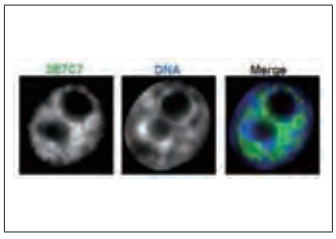
Receptor (G protein-coupled) activity modifying protein 1
#CAC-CNP-RAMP1-333
Western Blotting (Transfected lysate)



RELA (v-rel reticuloendotheliosis viral oncogene homolog A,nuclear factor of κ light polypeptide gene enhancer in B-cells 3, p65 (avian)) #CBX-CBX00563
Western Blotting analysis of immunized recombinant protein carrying 50-200 amino acids.



RFXAP (Regulatory factor X-associated protein)
#CBX-CBX00241
Western Blotting analysis of immunized recombinant protein, using anti-RFXAP monoclonal antibody.



RNA polymerase 2, CTD Ser2ph
#CAC-CE-030A
Immunocytochemical analysis of HeLa Cell using RNA polymerase 2, CTD Ser2ph antibody, 3E7C7.

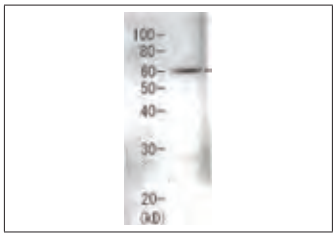
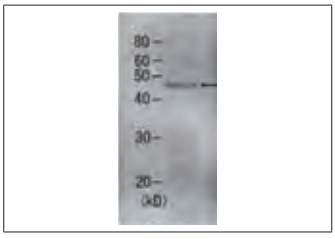
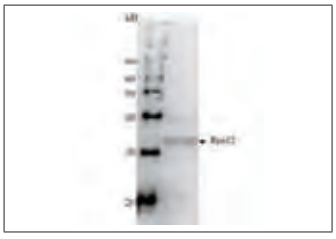
RuvA	Polyclonal	RAB	*Escherichia coli*	WB/ELISA/IP	–	BAM-61-005-EX	100 μℓ
RuvB	Polyclonal	RAB	*Escherichia coli*	WB/ELISA/IP	–	BAM-61-007-EX	100 μℓ
RUVBL1 (RuvB-Like 1 (*E. coli*))	Monoclonal 2943C1a	MS/IgG2b	HU	WB/IC/FC/DB	–	CBX-CBX00431	100 μg
RUVBL2 (RuvB-Like 2 (*E. coli*))	Polyclonal	RAB/IgG	HU	IP	–	CAC-CNP-RUVBL2-365	100 μℓ



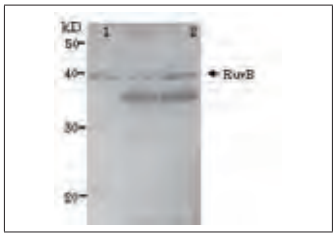
Rpn3
#BAM-62-201-EX
Detection of Rpn3 (60kDa) in the crude extract of S. cerevisiae by Western blotting using this antibody.



Rpn7
#BAM-62-205-EX
Detection of Rpn7 (49kDa) in the crude extract of S. cerevisiae by Western blotting using this antibody.



Rpn12
#BAM-62-209EX
Detection of Rpn1 2 (32kD) in the crude extract of S. cerevisiae by W estern blotting using this antibody.



RuvB
#BAM-61-007-EX
Detection of RuvB (37kD) protein by Western blotting usingthis antibody.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
RuvC	Polyclonal	RAB	*Escherichia coli*	WB	–	BAM-61-009-EX	100 µℓ

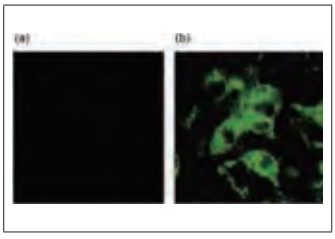
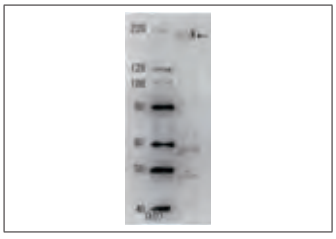
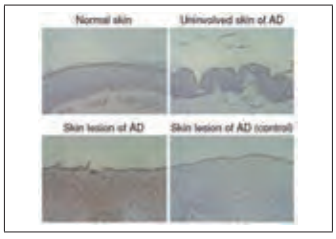
RuvC
#BAM-61-009-EX
Detection of RuvC (19kD) proteins in the cell extracts of 01-011 *E.coli*.



SARS
#BAM-65-101-EX
Identification of the spike antigen in the SARS virus infected cells by indirect immunostaining with 3A2 antibody
(a) Uninfected Vero E6 cells. (b) SARS virus infected Vero E6 cells.



SARS
#BAM-65-102-EX
Identification of the spike glycoprotein in the crude extract of the SARS virus infected cells by Western blotting using 3A2 antibody at 10,000 fold dilution.



SCCA
#CAC-SU-IZ-P04
Immunohistochemical staining of squamous cell carcinoma antigen (SCCA) in atopic dermatitis (AD) skin, and involved skin of AD patients with or without 200-fold diluted anti-SCCA monoclonal antibody is depicted.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size

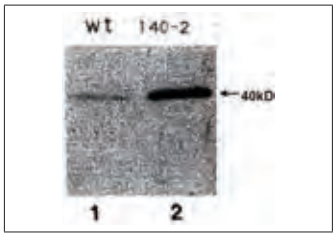
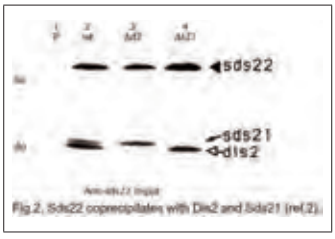
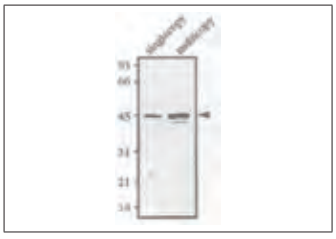
SF3B3	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0017	100 μℓ



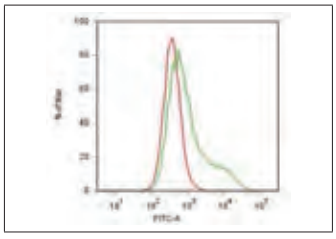
Sds22
#BAM-63-141-EX
Immunoblot with anti-Sds22 antiserum of yeast extracts from (1) wild type strain HM123, (2) sds::ura4+ deletion mutant carrying pHR140-2.



Sds22
#BAM-63-141-EX
Sds22 coprecipitates with Dis2 and Sds21.



Sds23
#BAM-63-143-EX
Identification of Sds23 protein.



Sema4b
#KAL-KO599
[FCM] COS cell expressing mouse Sema4b.

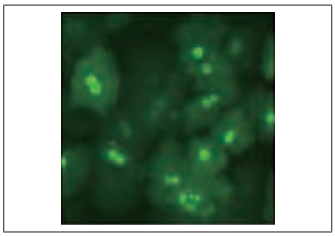
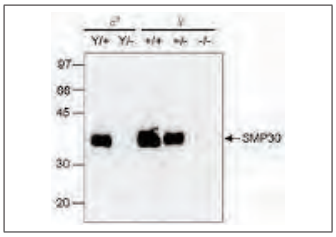
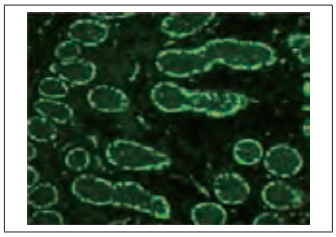
SMP 30
#SML-ROI001-EX
[Immunohistochemical staining]
Mouse liver stained with SMP30 antibody (ROI001) at 1:300 dilution and developed by 3,3' diaminobenzidine.



SMP 30
#SML-ROI001-EX
[Immunofluorescence staining]
Primary cultured mouse hepatocytes stained with SMP30 antibody (ROI001) at 1:200 dilutions.



SMP 30
#SML-ROI001-EX
Western blot analysis



Sox9
#KAL-KO608
IF Sample: mouse testis.

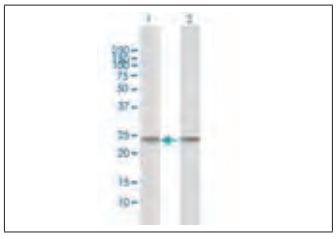
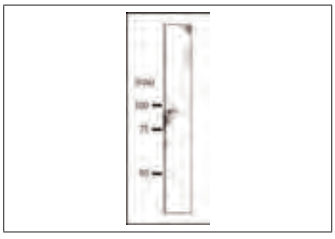
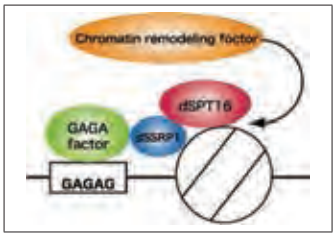
STAMBPL1 (STAM Binding Protein-like 1)	Monoclonal 2020C4a	MS/IgG1	HU	WB/DB	–	CBX-CBX00736	100 µg
Staphylococcus Aureus	Monoclonal 1F-05	MS/IgG2b	*Staphylococcus aureus*	WB	–	CAC-SBT-M04	100 µg (1 mg/mℓ)



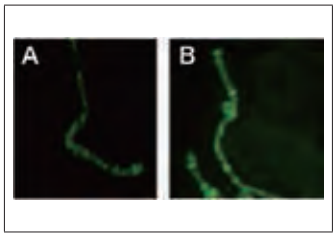
Spermatogenesis and oogenesis specific basic helix-loop-helix 2
#CAC-CNP-SOHLH2-371
Western Blotting (Transfected lysate).



Srb4p
#BAM-62-008-EX
Detection of Srb4p in crude extract of *S. cerevisiae* strain BY4741 (10 µg) by Western blotting using the Srb4p antibody.



SSRP1
#CAC-NIG-L1-SHA1
dSSRP1 and dSPT16 are a Drosophila counterpart of the FACT [Facilitates Chromatin Transcription] subunit.



SSRP1
#CAC-NIG-L1-SHA1
Immunostaining of a polytene chromosome (anti dSSRP1 antibody).

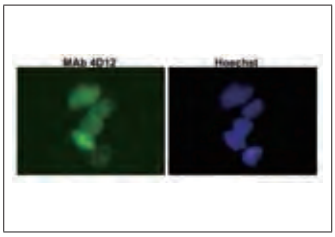
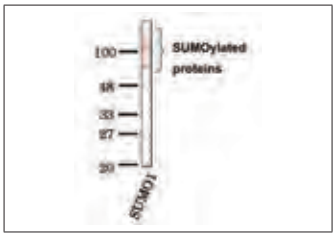
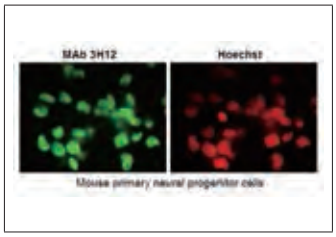
SUMO1
#BAM-70-653-EX
SUMO-1 colocalizes with SUMO2/3 as revealed by indirect immunofluorescence staing of C-33A cells (human cervix carcinoma).



SUMO1
#BAM-70-654EX
Immunofluorescence staining of SUMO-1 with the antibody 4D12 in the mouse primary culture neurons.



SUMO1
#BAM-70-655EX
Detection of SUMO-1 by Western blotting with the antibody 4D12.



SUMO2 and SUMO3
#CAC-CE-042A
Immunocytochemistry/ Immunofluorescence - SUMO2/3 antibody (3H12) Mouse primary culture neuron.

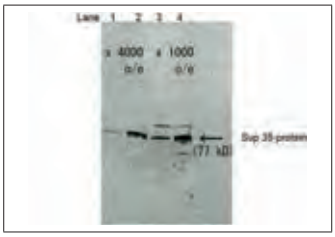
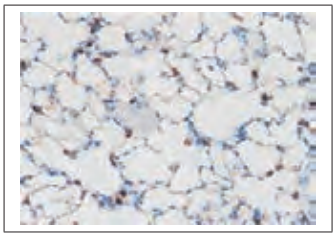
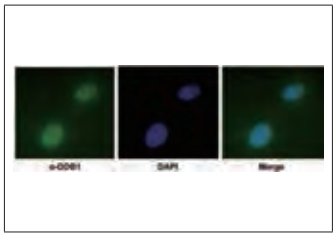
SUMO2 and SUMO3
#CAC-CE-042A
Western blot - SUMO1 antibody (4D12) and SUMO3 antibody (3H12) HeLa cell total extracts.



Sup35/PSI+
#BAM-62-300-EX
Identification of Sup35 protein in crude extracts of S. cerevisiae by western blotting with anti-Sup35 antibody.



Surfactant Protein D
#YMS-80075



Synthetic peptide derived from C-terminal region of human DDB1
#CAC-KUP-TM-M05
Immunofluorescence of U2OS cells with DDB1 mAb [Clone : 43233-3-1].

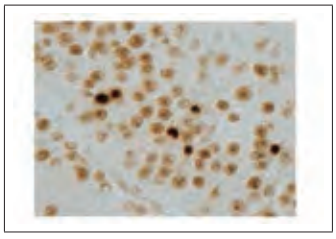
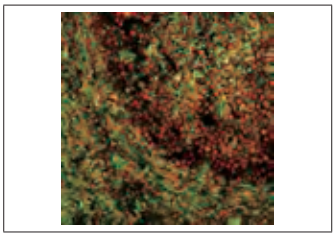
Lane 3. recombinant humanTDP-43.



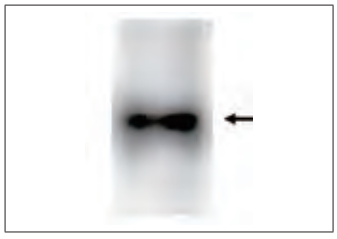
TDP-43 (405-414)
#CAC-TIP-TD-P09
Immunohistochemistry of Nuclei and NCIs in dentate gyrus of FTLD-U.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
Thyroxine Binding Globulin	Monoclonal 20F9	MS/IgG1 κ	HU	ELISA	–	LNM-KR-038	0.1 mg (1 mg/mℓ)
	Monoclonal 6F4	MS/IgG1 κ	HU	ELISA	–	LNM-KR-039	0.1 mg (1 mg/mℓ)
TIMELESS	Polyclonal	RAB/IgG	HU	WB	–	PRX-KD0081GNPAF	50 μg
TIMP-1	Monoclonal 7-6C1	MS/IgG1 κ	BOV/HU/RAT	IHC(p)/WB/EIA	–	DFK-F-23-EX	1 mℓ (500 μg)
	Monoclonal 147-6D11	MS/IgG1 κ	HU	IHC(p)/WB	–	DFK-F-26-EX	1 mℓ (500 μg)
TIMP-2	Monoclonal 67-4H11	MS/IgG1 κ	HU/MS/RAT/ BOV/RAB/GP	IHC(p)/IHC(f)/ WB/EIA	–	DFK-F-70-EX	1 mℓ (500 μg)
TIRAP (Toll-interleukin 1 receptor (TIR) domain containing adaptor protein)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-TIRAP-119	100 μℓ
TLN1 / KIAA1027	Polyclonal	RAB/IgG	MS	WB	–	PRX-MK10270310	0.1 mg
TLR2	Polyclonal	RAB/IgG	POR	WB/IHC/ELISA/ IP/FC	–	CAC-THU-A-TLR2	50 μℓ
TLR9	Polyclonal	RAB/IgG	POR	WB/IHC/ELISA/ IP/FC	–	CAC-THU-A-TLR9	50 μℓ
TLX	Monoclonal H6506	MS/IgG2a	HU	WB/ELISA/IP	–	PPX-PP-H6506-00	0.1 mℓ (1 mg/mℓ)
	Monoclonal H6510	MS/IgG2a	HU/MS/RAT	WB/IHC/ELISA/ IP	–	PPX-PP-H6510-00	0.1 mℓ (1 mg/mℓ)
TMCC2	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0481	100 μℓ
TMEM126B	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-TMEM126B-399	100 μℓ
TNF-α	Polyclonal	RAB	RAT	WB/ELISA	–	YII-YC030-EX	50 μℓ
	Polyclonal	GT	RAT	WB/ELISA	–	YII-YC031-EX	50 μℓ
	Polyclonal	MS	RAT	WB/ELISA	–	YII-YC032-EX	50 μℓ
TNNT1 (Troponin T type 1 (skeletal, slow))	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-TNNT1-311	100 μℓ
TNP-Ascaris	Polyclonal	RAT	–	IHC/IF	–	LSL-LB-8109	100 μℓ
TNPO3 (Transportin 3)	Monoclonal 3152C2a	MS/IgG2b	HU/MS/RAT	WB/IC/DB	–	CBX-CBX00492	100 μg
TNRC4	Polyclonal	RAB/IgG	HU	WB	–	PRX-KB7008GNPAF	50 μg
TNRC4 (ELAV-type RNA-binding protein 1)	Polyclonal	RAB	HU	WB	–	PRX-KB7008GNP	100 μℓ
TNXB	Polyclonal	RAB/IgG	HU	WB	–	PRX-KD0156GNPAF	50 μg
Toa1p	Polyclonal	RAB	YST	WB	–	BAM-62-021-EX	50 μℓ
	Polyclonal	RAB	YST	WB	–	BAM-62-022-EX	250 μℓ
TOB2	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA1663	100 μℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA1663PA	100 μg
TOE1 (Target of EGR1, member 1 (nuclear))	Monoclonal 3154C2a	MS/IgG1	HU	WB/FC/IP/DB	–	CBX-CBX00480	100 μg
TOMM70A	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0719AF	50 μg
Total Glucagon	Polyclonal	RAB	HU/RAT	IHC/RIA	–	YII-YP040-EX	50 μℓ
Total-PSA	Monoclonal 4D10	MS/IgG1 κ	HU	ELISA	–	LNM-KR-036	0.1 mg (1 mg/mℓ)
	Monoclonal No.56	MS/IgG2a κ	HU	ELISA	–	LNM-KR-037	0.1 mg (1 mg/mℓ)
TP53I3 (Tumor protein p53 inducible protein 3)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-TP53I3-531	100 μℓ
TP53 (Tumor protein p53 (Li-Fraumeni syndrome))	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-TP53-517	100 μℓ
TP (Thromboxane A2 Receptor)	Polyclonal	MS	MS	ELISA/IF	–	KAL-KO578	100 μℓ (0.25 mg/mℓ)
TPX2 (Microtubule-associated, homolog (*Xenopus laevis*))	Monoclonal 3164C6a	MS/IgG1	HU	WB/IC/FC/IP/DB	–	CBX-CBX00456	100 μg

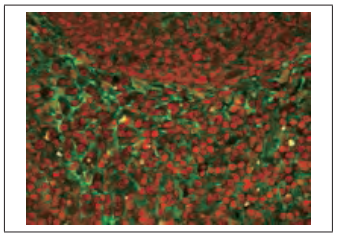
TLR2
#CAC-THU-A-TLR2
Western blot analysis of TLR2 protein expressed in mesenteric lymph nodes of adult porcine.
Predicted molecular weight: 87kDa.



TLR2
#CAC-THU-A-TLR2
Localization of TLR2 in longitudinal section of mesenteric lymph nodes of adult porcine. Green: TLR2, Red: nuclei.

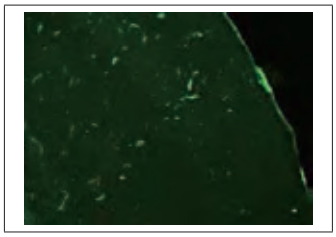


TLR9
#CAC-THU-A-TLR9
Western blot analysis of TLR9 protein expressed in mesenteric lymph nodes of adult porcine.
Predicted molecular weight: 113kDa.

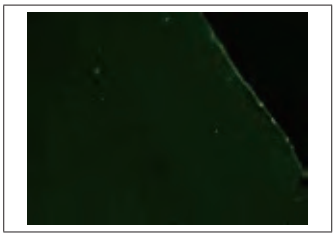


TLR9
#CAC-THU-A-TLR9
Localization of TLR9 in longitudinal section of peyer's patches of adult porcine.
Green: TLR9, Red: nuclei.

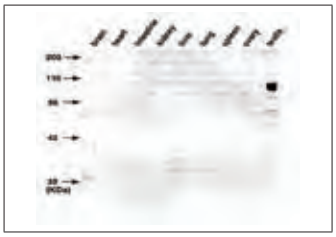
Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
TR2 (Testicular orphan receptor 2)	Monoclonal H0037	MS/IgG2b	HU	WB/ELISA/IP	–	PPX-PP-H0037-00	0.1 mℓ (1 mg/mℓ)
TR4 (Testicular orphan receptor 4)	Monoclonal H0107B	MS/IgG2a	HU/MS/RAT	WB/IHC/ELISA/IP	–	PPX-PP-H0107B-00	0.1 mℓ (1 mg/mℓ)
TRA98	Monoclonal TRA98	MS/IgG2a	MS	WB/IHC	–	BAM-73-004-EX	250 μg
TRAFD1 (TRAF-type zinc finger domain containing 1)	Monoclonal 2368C3a	MS/IgG2b	HU	WB/DB	–	CBX-CBX00774	100 μg
TRALPHA (TR α)	Monoclonal H2804	MS/IgG2a	HU/MS/RAT	WB/IHC/ELISA	–	PPX-PP-H2804-00	0.1 mℓ (1 mg/mℓ)
Transaldolase 1	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-TALDO1-238	100 μℓ
Transcription factor A, mitochondrial (TFAM)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-TFAM-598	100 μℓ
Transcription factor AP-2 α (activating enhancer binding protein 2 α) (TFAP2A)	Monoclonal 959C2a	MS/IgG1	HU/MS	WB/FC/DB	–	CBX-CBX00315	100 μg
Transcription factor AP-2 γ (activating enhancer binding protein 2 γ) (TFAP2C)	Monoclonal AP25H01	MS/IgG1	HU	WB/DB	–	CBX-CBX00137	100 μg
Transcription factor AP-4 (activating enhancer binding protein 4) (TFAP4)	Monoclonal 961C5a	MS/IgG1	HU	WB/DB	–	CBX-CBX00354	100 μg
Transcription factor Dp-2 (E2F dimerization partner 2) (TFDP2)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-TFDP2-514	100 μℓ
	Monoclonal TFD5I455	MS/IgG1	HU	WB/DB	–	CBX-CBX00192	100 μg
Transcription factor EB (TFEB)	Monoclonal 319C2a	MS/IgG1	HU	DB/WB	–	CBX-CBX00662	100 μg
Transferrin	Monoclonal 6E6	MS/IgG1 κ	HU	ELISA	–	LNM-KR-042	0.1 mg (1 mg/mℓ)
	Monoclonal 7B2	MS/IgG1 κ	HU	ELISA	–	LNM-KR-043	0.1 mg (1 mg/mℓ)
	Monoclonal TH-001	MS/IgG1 κ	HU	–	–	NBT-MTH-001	1 mg
	Monoclonal TH-002	MS/IgG1 κ	HU	–	–	NBT-MTH-002	1 mg
	Monoclonal TH-003	MS/IgG1 κ	HU	–	–	NBT-MTH-003	1 mg
	Monoclonal TH-004	MS/IgG1 κ	HU	–	–	NBT-MTH-004	1 mg
	Monoclonal TH-005	MS/IgG1 κ	HU	–	–	NBT-MTH-005	1 mg
	Monoclonal TH-006	MS	HU	–	–	NBT-MTH-006	1 mg
	Monoclonal TH-007	MS	HU	–	–	NBT-MTH-007	1 mg
	Monoclonal 10C3	MS/IgG2b κ	MS	–	–	YMS-7619	200 μg
	Monoclonal 1H10	RAT/IgG1 κ	MS	–	HRP	YMS-7970	200 μℓ (200 μg)
Transferrin Receptor	Monoclonal No.57	MS/IgG1 κ	HU	ELISA	–	LNM-KR-044	0.1 mg (1 mg/mℓ)
	Monoclonal No.143	MS/IgG1 κ	HU	ELISA	–	LNM-KR-045	0.1 mg (1 mg/mℓ)
TRAP1 (TNF receptor-associated protein 1)	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-TRAP1-414	100 μℓ
TRBETA1 (TR β 1)	Monoclonal H3825A	MS/IgG2a	HU	WB/ELISA/IP	–	PPX-PP-H3825A-00	0.1 mℓ (1 mg/mℓ)
Treg	Monoclonal TH6	RAT	MS	FC/IP	–	REC-RCAB010M-F	100 μℓ (1 mg/mℓ)



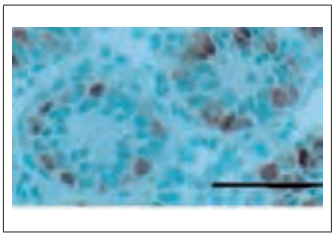
TP (Thromboxane A2 Receptor)
#KAL-KO578
Immunofluorescence
Mouse Cerebral cortex tissue.



TP (Thromboxane A2 Receptor)
#KAL-KO578
Immunofluorescence
TP deficient mouse Cerebral cortex tissue.



TRA98 (clone TRA98)
#BAM-73-004-EX
Western blot analysis with TRA98 of various mouse tissues.



TRA98 (clone TRA98)
#BAM-73-004-EX
Immunohistochemical staining of a 7-day-old testis with germ cell-specific antibody, TRA98.

Antigen	Clonality	Host/Isotype	Cross Reactivity	Applications	Conjugation	Cat. #	Size
Treg	Monoclonal TH6	RAT	MS	FC/IP	Biotin	REC-RCAB010M-FB	100 µℓ (1 mg/mℓ)
	Monoclonal TH6	RAT	MS	FC/IP	FITC	REC-RCAB010M-FF	100 µℓ (1 mg/mℓ)
	Monoclonal 12A5	RAT	MS	WB/FC/IP	–	REC-RCAB011M-F	100 µℓ (1 mg/mℓ)
	Monoclonal 12A5	RAT	MS	WB/FC/IP	Biotin	REC-RCAB011M-FB	100 µℓ (1 mg/mℓ)

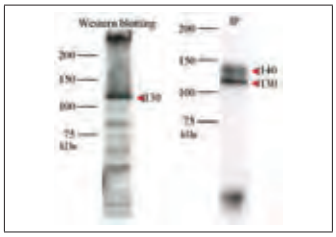
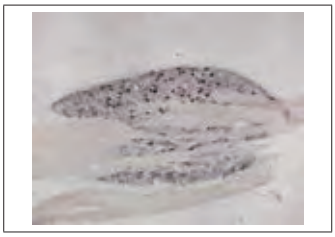
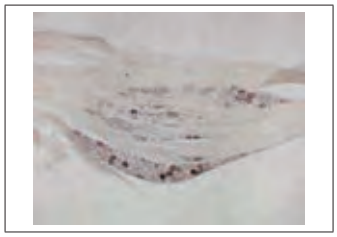
Trpm7	Polyclonal	RAB	HU/MS	ELISA	–	KAL-KO464	25 μg (100 μℓ /vial)
TRPV1, VR1	Polyclonal	RAB/IgG	RAT	IHC	–	KAL-KM018	5 μg
TRPV2, VRL1	Polyclonal	RAB/IgG	RAT	IHC	–	KAL-KM019	5 μg
TRPV 4 (TRP vanilloid 4)	Polyclonal	RAB	MS	WB	–	KAL-KM119	25 μg (0.25 mg / mℓ)
TSC1 (Hamartin)	Polyclonal	RAB/IgG	MS	WB	–	PRX-MK02430310	0.1 mg
TSNAX (Translin-associated factor X)	Monoclonal 3179C2a	MS/IgG2b	HU	WB/DB	–	CBX-CBX00568	100 μg
TSPYL4	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA0721AF	50 μg
TSPYL5	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA1750AF	50 μg
TTC7A (Tetratricopeptide repeat domain 7A)	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA1140	100 μℓ
TTC35 (Tetratricopeptide repeat domain 35)	Monoclonal 3342C1a	MS/IgG1	HU	WB/DB	–	CBX-CBX00585	100 μg
TTLL12 (Tubulin tyrosine ligase-like family, member 12)	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA0153	100 μℓ
TUBB1, Tubulin, β 1	Monoclonal 600C2a	MS/IgG1	HU	WB/DB/IC	–	CBX-CBX00711	100 μg
TUBD1, Tubulin, δ 1	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-TUBD1-091	100 μℓ
	Monoclonal 3183C3a	MS/IgG1	HU	WB/DB	–	CBX-CBX00481	100 μg
TUBG1, Tubulin, γ 1	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-TUBG1-060	100 μℓ
TUBGCP2, Tubulin, γ complex associated protein 2	Polyclonal	RAB/IgG	HU	WB/IP	–	CAC-CNP-TUBGCP2-135	100 μℓ
TULP4 (Tubby like protein 4)	Polyclonal	RAB	HU/MS	WB	–	PRX-MKA1397	100 μℓ
	Polyclonal	RAB/IgG	HU/MS	WB	–	PRX-MKA1397PA	100 μg
Tumor necrosis factor, α-induced protein 8-like 2 (TNFAIP8L2)	Polyclonal	RAB/IgG	HU	WB	–	CAC-CNP-TNFAIP8L2-190	100 μℓ
TUPLE1 (TUP1-like enhancer of split gene 1)	Monoclonal 374C6a	MS/IgG2a	HU	WB/DB/IC	–	CBX-CBX00669	100 μg



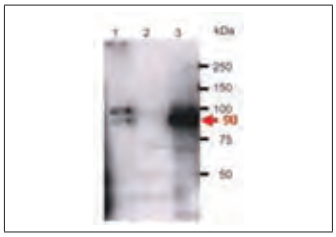
TRPA 1
#KAL-KM120
Sample: HEK293 cells overexpressing mouse TRPA1 (cell membrane fraction)
Left: Western blotting
Right: Immunoprecipitation



TRPV1, VR1
#KAL-KM018
Dorsal root ganglion (DRG) of lumbar region (normal rat), 308m of thickness.



TRPV2, VRL1
#KAL-KM019
Dorsal root ganglion (DRG) of lumbar region (normal rat), 308m of thickness.



TRPV 4 (TRP vanilloid 4)
#KAL-KM119
Western blotting
Lane 1: choroid plexus (Wild type mouse)
Lane 2: choroid plexus (TRPV4 knockout mouse)
Lane 3: rat TRPV4 overexpressed in HEK293 cells

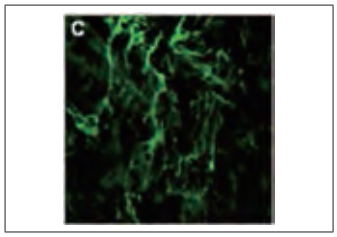
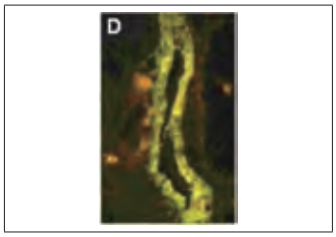
Versican/CSPG2 #CAC-PRPG-VS-M01
Immunoblotting of intact versican (mixture of V1 and V2 isoforms) prior to (Intact) and after combined chondroitinase ABC (Chase ABC) and endo- -galactosidase-digestion (Digested) form. The proteoglycan was resolved by SDS-PAGE under reducing conditions on 3-8% linear gradient gels (MW, HiMark Unstained Protein Standard).

Versican [CSPG2] (5C12)
#CAC-PRPG-VS-M01
Immunohistochemistry on human normal urinary bladder.



Versican [CSPG2] (5C12)
#CAC-PRPG-VS-M01
Immunostaining of versican in the matrix deposited *in vitro* of human microvascular endothelial cells after TNF stimulation.



Versican [CSPG2] (5C12)
#CAC-PRPG-VS-M01
Immunostaining of versican lining the wall of a larger vein in human kidney (PFA-fixed frozen section).

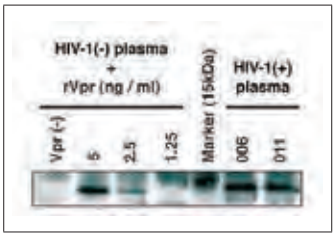
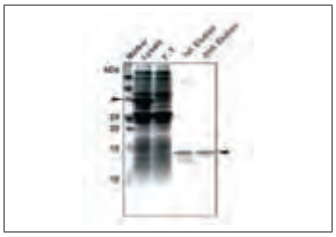
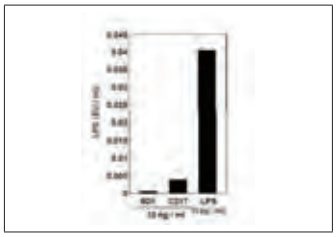
Vpr peptide
#CAC-NCG-M01
Western blotting with 8D1 antibody using whole cell extracts of Chromatin fraction.



Vpr peptide
#CAC-NCG-M01
Detection (or IP-WB analysis) of Vpr in plasma of HIV-1-positive patients.



Vpr peptide
#CAC-NCG-M01
LPS-free Vpr protein purification using a glutathione column and an affinity column with anti-Vpr antibody (8D1), 1st. Elution: Glutathione column, 2nd. Elution: 8D1 affinity column.



Vpr peptide
#CAC-NCG-M01
LPS-free Vpr protein purification using a glutathione column and an affinity column with anti-Vpr antibody (8D1), 8D1: anti-Vpr monoclonal antibody Cat#CAC-NCG-M01, C217: anti-Vpr monoclonal antibody.

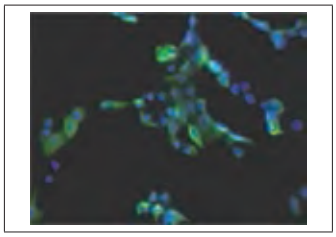
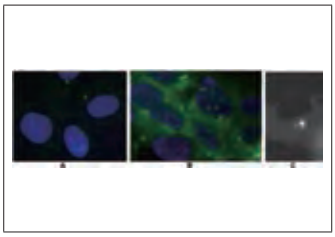
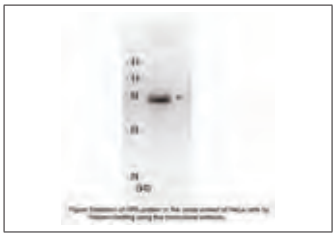
ZFP292 / KIAA0530	Polyclonal	RAB/IgG	MS	WB	–	PRX-MK05300910	50 µg



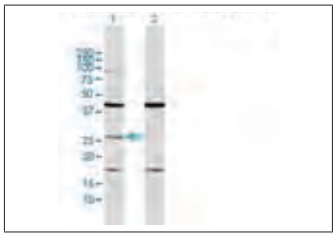
WDR45L #CAC-ICA-TG3-MSP1
Immunohistochemistry: Hela cells transfected with plasmid encoding mouse WDR45L were fixed, permeabilized and stained with Rabbit anti- mouse WDR45L Polyclonal Antibodies diluted 1/100 and Alexa488 goat anti mouse IgG secondary antibody. Nuclei were counterstained with DAPI.



Whole length of human γ-tubulin 1 protein #CAC-NM-MA-003
Monoclonal antibody (E39) recognizes γ-tubulin located at the centrosomes.



XPA (Xeroderma Pigmentosum Group A) #BAM-70-032-EX
Detection of XPA protein in the crude extract of HeLa cells by Western blotting using this monoclonal antibody.



YWHAG (Tyrosine 3-monooxygenase/ tryptophan 5-monooxygenase activation protein, γ polypeptide) #CAC-CNP-YWHAG-521
Western Blotting (Transfected lysate).

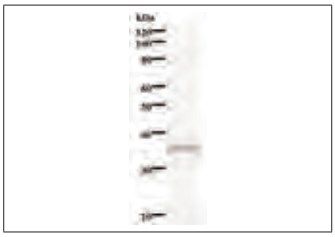
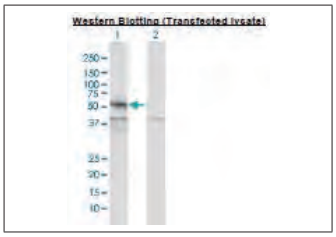
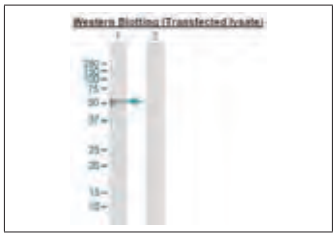
Zmat4 (Zinc finger matrin type 4)
#KAL-KG407



ZNF3 (Zinc finger protein 3)
#CBX-CBX00777
Western blot analysis of immunized recombinant protein, using anti-ZNF3 monoclonal antibody.



ZNF92 (Zinc Finger Protein 92)
#CAC-CNP-ZNF92-118
Western Blotting (Transfected lysate).



ZNF253 (Zinc Finger Protein 253)
#CAC-CNP-ZNF253-373
Western blot analysis of ZNF253 expression in transfected 293T cell line by ZNF253 rabbit polyclonal antibody.

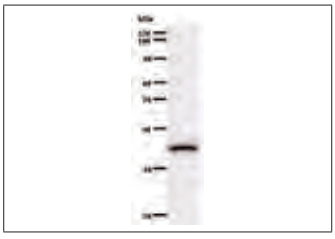
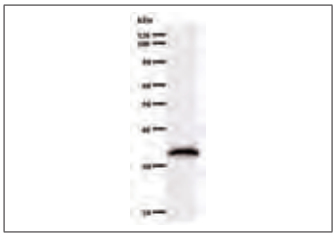
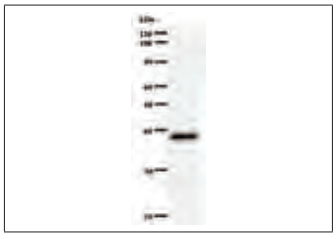
ZNF354A (Zinc Finger Protein 354A)
#CBX-CBX00529
Western blot analysis of immunized recombinant protein, using anti-ZNF354A monoclonal antibody.



ZNF544 (Zinc Finger Protein 544)
#CBX-CBX00510
Western blot analysis of immunized recombinant protein, using anti-ZNF544A monoclonal antibody.



ZNF596 (Zinc Finger Protein 596)
#CBX-CBX00494
Western blot analysis of immunized recombinant protein, using anti-ZNF596A monoclonal antibody.



ZW10 (Kinetochore associated, homolog (*Drosophila*)) #CBX-CBX00511
Western blot analysis of immunized recombinant protein, using anti-ZW10 monoclonal antibody.

Monoclonal Antibodies against DNA Damage

Powerful tools for studying DNA damage and its biological effects

Monoclonal antibodies against UV-induced DNA Damage

Anti Cyclobutane Pyrimidine Dimers (CPDs) [Clone : TDM-2]
Anti (6-4) photoproducts (6-4PPs) [Clone : 64M-2]
Anti Dewar photoproducts (DewarPPs) [Clone : DEM-1]

Prolonged exposure to solar UV radiation may result in acute and chronic health effects to the skin, eye, and immune system, including skin cancers. These harmful effects are suggested to be closely related to DNA damage. The major types of DNA damage induced by solar UV radiation are cyclobutane pyrimidine dimers (CPDs), (6-4) photoproducts (6-4PPs), and Dewar photoproducts (DewarPPs), which are formed between adjacent pyrimidine nucleotides on the same strand of DNA. These helix-distorting DNA lesions are repaired exclusively by a nucleotide excision repair system in humans. Mori *et al.* have developed and characterized monoclonal antibodies specific for CPDs and for 6-4PPs (1). Matsunaga *et. al.* have established and characterized monoclonal antibodies against DewarPPs (2). These antibodies enable one to quantitate photoproducts in DNA purified from cultured cells or from the skin epidermis using an enzyme-linked immunosorbent assay (ELISA) and to visualize and measure photoproducts in DNA in cultured cells or the skin using indirect immunofluorescence. Thus, this technology will contribute to understanding the molecular mechanisms of cellular responses to UV light and DNA damage in many research fields including cancer research, photobiology, dermatology, ophthalmology, immunology, and cosmetology.

Features

- Highly specific for the target lesion
- Research applications include ELISA, IF and IHC
- Useful for research in DNA damage and repair
- Allows visualization of the DNA repair process
- Applicable to a broad range of research fields including cancer research, photobiology, dermatology, ophthalmology, immunology, and cosmetology

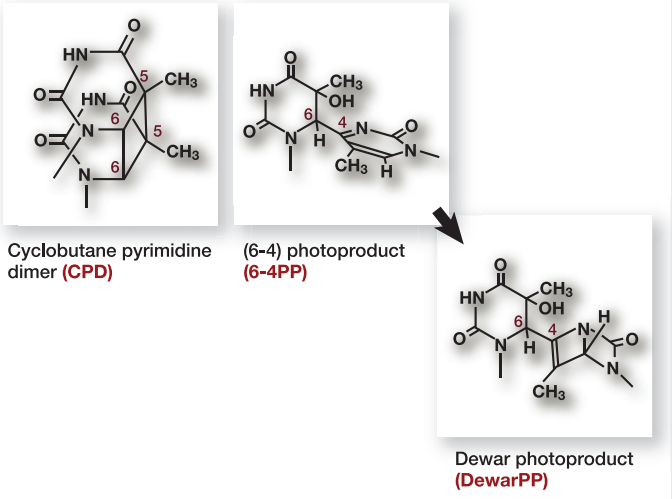
UV-induced major DNA damage



Cyclobutane pyrimidine dimer **(CPD)**

(6-4) photoproduct **(6-4PP)**

Dewar photoproduct **(DewarPP)**

Description	Host	Clone	Application	Cat. No.	Quantity
Anti CPDs	Mouse	TDM-2	ELISA / IC	CAC-NM-DND-001	1 vial
Anti 6-4PPs	Mouse	64M-2	ELISA / IC	CAC-NM-DND-002	1 vial
Anti DewarPPs	Mouse	DEM-1	ELISA / IC	CAC-NM-DND-003	1 vial

COSMO BIO CO., LTD.

Detection and Measurement

DNA-Damage Markers - 8-OHdG Check ELISA KIT

Intended Use

This product is an 8-OHdG ELISA kit utilizing anti 8-OHdG monoclonal antibody (clone N45.1 Cat# NNS-MOG-020P-EX) which is highly specific for 8-OHdG. We provide two types of 8-OHdG ELISA kits with different assay ranges. The new 8-OHdG Check ELISA is suitable for urine and serum samples from animal and human. If you are planning to measure 8-OHdG in human serum, tissue, cultured cells, we recommend to use Highly Sensitive 8-OHdG Check ELISA.

8-hydroxy-2'-deoxyguanosine (8-OHdG) is a product of oxidatively damaged DNA formed by hydroxy radical, singlet oxygen and direct photodynamic action. 8-OHdG can be detected in tissue, serum, urine and other biomaterials. New 8-OHdG Check is a competitive enzyme-linked immunosorbent assay (ELISA) utilising monoclonal antibody (clone N45.1) which is highly specific for DNA damage and does not cross react with RNA oxidation products such as 8-hydroxy-guanine and 8-hydroxy-guanosine.

This product is suitable for detection of 8-OHdG in urine and other biomaterials from human and animals.

Composition

- 8-OHdG Microtiter Plate : Precoated with 8-OHdG (12 × 8wells, split type) : 1 plate
- Primary Antibody : Anti 8-OHdG antibody, powder : 1 vial
- Primary Antibody Solution : 1 vial (6 mℓ)
- Secondary Antibody : HRP-anti mouse antibody, powder : 1 vial
- Secondary Antibody Solution : 1 vial (12 mℓ)
- Chromatic Solution : 3,3',5,5'-tetramethylbenzidine : 1 vial (0.25 mℓ)
- Diluting Solution : H_2O_2 containing buffer : 1 vial (12 mℓ)
- Washing Solution (5x) : 2 vials (26 mℓ×2)
- Reaction Terminating Solution : 1M Phosphoric acid : 1 vial (12 mℓ)
- Standard 8-OHdG Solution : Purified 8-OHdG (0.5, 2, 8, 20, 80, 200 ng/mℓ) : 1 vial each
- Plate Seal : 2 sheets

Description	Antigen	Reacts with	Applicable Sample	Measurement Range	Supplementary	Cat. No.	Quantity
8-OHdG Check ELISA kit	8-OHdG/ 8-oxo-dG	Animal	Serum, Urine	0.5 - 200 ng/mℓ	Competitive	NNS-KOG-200SE-EX	96 well
Highly Sensitive 8-OHdG Check ELISA kit	8-OHdG/ 8-oxo-dG		Serum, Urine, Tissue, Cultured cells	0.125 - 10 ng/mℓ	Competitive	NNS-KOG-HS10E-EX	96 well

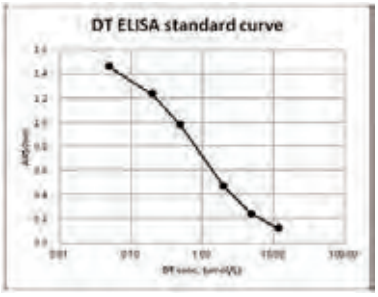
Protein Damage Markers - Dityrosine (DT) ELISA kit

Intended Use

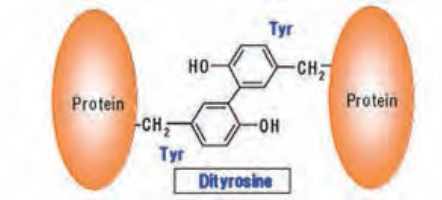
Dityrosine is one of the specific biomarkers for protein oxidation. This DT ELISA kit is designed for quantitative measurement of DT especially in urine samples.

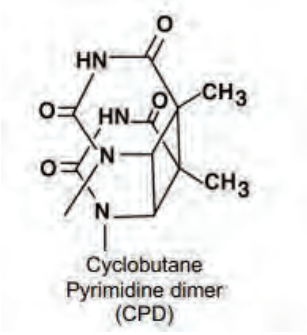
Tyrosine is one of the major targets of protein oxidation, and until today various tyrosine derivatives such as nitrotyrosine, dityrosine and halogenated tyrosine depending on the type of free radicals. DT is a tyrosine dimer derived from tyrosyl radicals which is formed by reactive oxygen species (ROS), metal-catalyzed oxidation, ultraviolet irradiation, and peroxidases. DT have been found in atherosclerotic lesions, and lipofuscin of pyramidal neurons of aged human brains.

Recently, dityrosine is reported to exist also in urine samples. It is expected that DT may be a novel protein oxdation marker,which is non-invasively detectable.

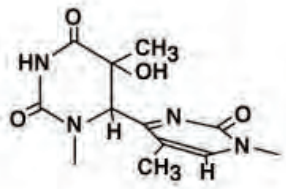


A standard curve example

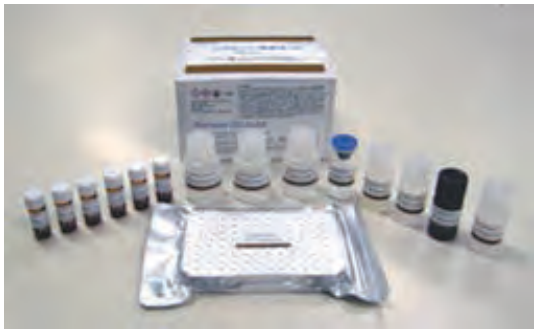




Cyclobutane Pyrimidine dimer (CPD)



(6-4)photoproduct (6-4PP)



Composition

- DT Microtiter Plate Precoated with DT (8× 12 wells, split type) : 1 plate
- Primary Antibody Anti DT monoclonal antibody (ready to use) : 1 vial (7 mℓ)
- Secondary Antibody HRPconjugated antimouse antibody : 1 vial
- Secondary Antibody Solution Phosphate Buffered Saline : 1 vial (12 mℓ)
- TMB Substrate Chromogen (ready to use) : 1 vial (12 mℓ)
- Stop Solution 1.96% Sulfuric acid (ready to use) : 1 vial (12 mℓ)
- Washing Solution (x5) Concentrated wash buffer : 3 vials (25 mℓ×3)
- DT Standards DT standards (ready to use) : 1 vial each (0.5 mℓ)
- Plate seal : 2 sheets

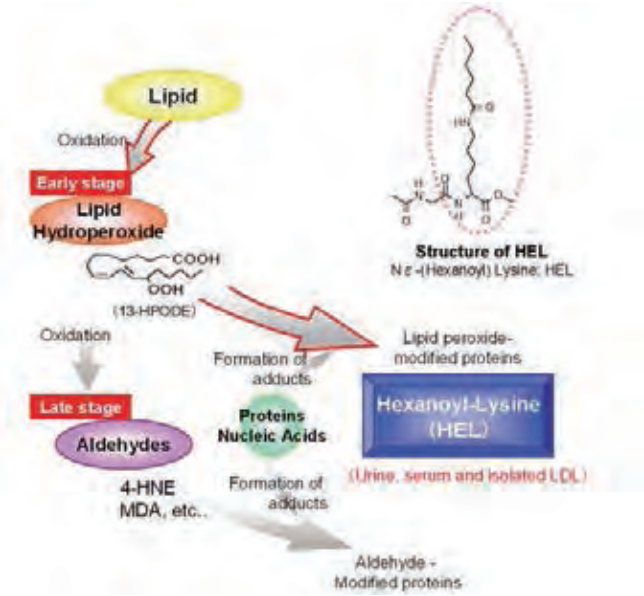
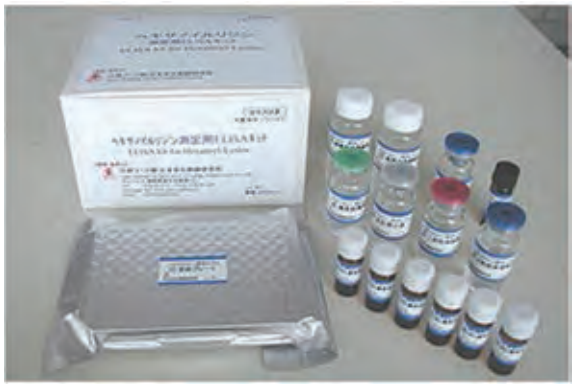
Lipid Peroxide Markers - Hexanoyl-Lys (HEL) ELISA kit

Intended Use

HEL may be a useful biomarker for initial stage of lipid peroxidation. Monoclonal antibodies. This HEL ELISA kit can be applied to urine, serum and cultured cells form human and animal.

Oxidative damage of lipids caused by reactive oxygen species (ROS) play an important role in some diseases, lesion of cell functions and aging. Aldehydes such as malondialdehyde (MDA) and 4-hydroxy-2-nonenal (4-HNE) have been reported as one of the advanced lipid peroxidation products. But recently in the earlier stage of lipid peroxidation, 13-hydroperoxyoctadecanoic acid (13-HPODE) is found to be covalently bound to proteins (1). Hexanoyl-Lysine adduct (HEL) is a novel lipid hydroperoxide-modified lysine residues. HEL is formed by oxidative modification by oxidized ω-6 fatty acids such as linoleic acid or arachidonic acid. HEL may be a useful biomarker for initial stage of lipid peroxidation. Monoclonal antibodies and ELISA kit have been developed, and HEL can be detected in oxidatively modified LDL, in human atherosclerotic lesions, human urine and serum. It is also reported that HEL is formed in rat muscle during exercise, and the formation is prohibited by antioxidants such as flavonoids.





Composition

- HEL Microtiter Plate Precoated with HEL (8×12 wells, Split Type) : 1 Plate
- Primary Antibody Monoclonal Antibody specific for HEL : 1 Vial (7 mℓ)
- Secondary Antibody HRP-Conjugated Anti Mouse IgG Antibody : 1 Vial
- Secondary Antibody Buffer Phosphate Buffered Saline : 1 Vial (12 mℓ)
- Chromogen 3,3',5,5'-Tetramethylbenzidine : 1 Vial (250 μℓ)
- Chromogen Buffer Hydrogen Peroxide/ Citrate-Phosphate Buffer : 1 Vial (12 mℓ)
- Washing Buffer (5X) Concentrated Phosphate Buffered Saline : 2 Vials (25 mℓ × 2)
- Stop Solution 1M Phosphoric acid : 1 Vial (12 mℓ)
- Standard A-F Bz-Gly-Hexanoyl-Lys : 1 Vial each (500 μℓ)
- Plate Seal Adhesive seal to prevent evaporation : 2 Sheets

High Sensitivity CPD ELISA kit

Background

Cyclobutane pyrimidine dimers (CPDs) ELISA kit is optimized for high sensitivity detection of CPDs in DNA purified from cultured cells or from the skin epidermis using an enzyme-linked immunosorbent assay (ELISA). This system can detect CPDs formed in every dipyrimidine sequence (TT, TC, CT and CC) in DNA. Thus, this technology will contribute to understanding the molecular mechanisms of cellular responses to UV light and DNA damage in many research fields including cancer research, photobiology, dermatology, ophthalmology, immunology, and cosmetology.

Principle

To measure DNA damage in DNA, we use ELISA (enzyme-linked immunosorbent assay) using Anti-CPDs (Clone: TDM-2). Genomic DNA is purified from UV-damaged cells and heat denatured DNA is coated on wells of 96-well plate. The binding of TDM-2 to DNA damage is detected by sequential treatment with biotinylated 2nd antibody and streptavidin-peroxidase. The absorbance of colored products derived from OPD is measured at 492nm.

Composition

- PROTAMINE SULFATE COATED ELISA PLATE 96 : (8×12) 1 plate
- Positive CPD Standard using Calf thymus DNA (UVC irradiation : 0 J/㎡) : 10 μg/mℓ, 100 μℓ /vial,1 vial (Lyophilized)
- Assay Diluent (10X) : 10 mℓ, 1 bottle (Liquid)
- Wash Buffer (20X) : 15 mℓ, 2 bottles (Liquid)
- Blocking Reagent (50X) : 200 μℓ /vial, 2 vials (Lyophilized)
- Anti-CPDs (100X) : 150 μℓ /vial, 1 vial (Lyophilized)
- Biotinylated 2nd antibody (100X) : 150 μℓ /vial, 1 vial (Lyophilized)
- Streptavidin-peroxidase (100X) : 150 μℓ /vial, 1 vial (Lyophilized)
- OPD Tablet (2mg) : 2 tablets
  OPD Diluent (10X) : 600 μℓ, 2vials (Liquid)
- Stop Solution : 12 mℓ, 1 bottle (Liquid)
- Cover Film : 3 sheets
  Instruction manual : 1

FASTKIT ELISA ver.III

Intended Use

This product is a food allergen screening test kit which can detect egg proteins in foods.This product is based on the guidelines shown by CAA Notification No. 286 from the Japan Deputy Secretary General of the Consumer Affairs Agency dated September 10, 2010, "Test methods for food products containing allergic substances." This product can measure specific proteins in the food such as raw materials and processed foods widely.
According to CAA Notification No. 36 from the Deputy Secretary General of the Consumer Affairs Agency dated March 26, 2014, " Partial Revision of "Test methods for food products containing allergic substances," This is the improved kit by removing 2-mercaptoethanol from "FASTKIT ELISA Ver.II". In addition, according to a separate attachment 6 of CAA Notification No.36 from the Deputy Secretary General of the Consumer Affairs Agency "Guidelines for Evaluating Improved Methods of the Test Methods for Food Products Containing Allergic Substances," it has been confirmed that its performance is equal to that of "FASTKIT ELISA Ver.II".

Composition

- Antibody-immobilized microtiter plate (with a cover) : A 96-well microtiter plate (8 wells×12 lanes)×1
- Standard solution (50 ng/mℓ);manufactured by Nippon Gean Co., Ltd. : 1.8 mℓ×1
- Dilution buffer : 100 mℓ×1
- Biotin-conjugated antibody : 150 μℓ×1
- Streptavidin-conjugated enzyme (peroxidase) : 150 μℓ×1
- Chromogenic substrate (TMB) : 12 mℓ×1
- Solution to stop reaction (0.5N H2SO4) : 12 mℓ×1
- Concentrate wash solution (10-fold condensate) : 100 mℓ ×1
- Concentrate extraction buffer 1. (20-fold condensate) : 50 mℓ×1
- Concentrate extraction buffer 2. (20-fold condensate) : 50 mℓ×1
- Concentrate extraction buffer 3. (20-fold condensate) : 50 mℓ×1
- Instruction leaflet : 1 copy

BroadCheck Metallothionein kit

Background

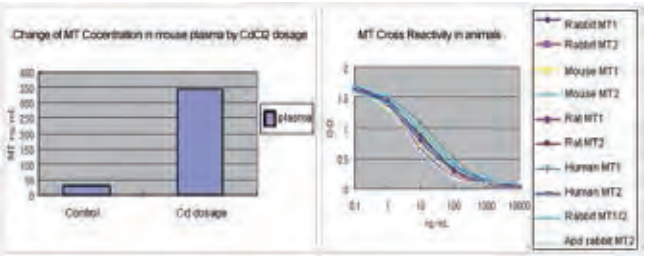
Metallothionein (MT) which is Cd binding protein have discovered from horse kidney by Margoshe and Vallee in 1957. MT is present in all animal cells and has strong affinity against another heavy metal. The physiological role are concerned in detoxication of organic metal, metabolic regulation of bioessential metal, protection from stress and free radical. However, to obtain high affinity anti MT antibody was very hard because MT is a cysteine rich (about 30%), low molecular weight protein and by the absence of aromatic amino acid in this structure. Therefore, the high sensitive ELISA system has not been established and difficult to investigate the behavior of MT *in vivo*.
We developed anti MT antibody and established the high sensitivive ELISA system for determining human and animal MT. The epitope of this antibody is located at NH2 terminals acetylated peptides in MT, therefore can assay native MT. In addition, NH2 terminals of MT is high conserved sequence in many animal species, therefore almost animals MT can measure in this ELISA kit.

Features

The kit is for quantitative detection and the procedure of this assay is simple, easy and hardly influenced by physiological active substances and body fluid. The epitope of this antibody we used in this kit is located at NH2 terminals and acetylated peptides in MT. MT I and II which have common NH2 terminals sequence can react against this antibody.

Specificities

The antibody in this kit can recognize the N terminals, especially acetyl group of N terminal amino acid. Therefore, the cross reactivity against recombinat MT protein expressed in bacteria are under 5%.



Composition

- Antigen coated 96well plate
- MT standard
- Standard diluent
- Antibody solution
- 2nd antibody
- 2nd antibody diluent
- Enzyme Substrate
- Stop solution
- Concentrated washing solution
- Plate seal

Assay Principle

This ELISA kit adopts indirect competitive reaction using the rabbit MT polyclonal antibody which recognize the N terminals of MT. The MT are coated in the surface of 96 wells plate, onto which standard of MT or samples to be measured and anti MT antibody are overlaid and incubate. After a washing step, HRP-conjugated anti rabbit antibody is added and incubate again. HRP conjugated antibody and anti MT antibody - MT complex are formed. After a washing, substrate is added, which reacts with the HRP conjugate to produce blue colors. More blue color means less MT. The optical densities are measured and plotted to calculate the exact concentration of MT.

BroadCheck Deoxynivalenol kit

Background

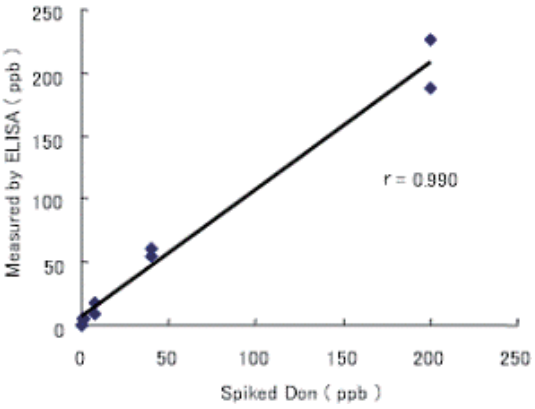
Deoxynivalenol (DON) belongs to the trichothecene family mycotoxin and is most produced of Fusarium graminearum. DON often occurs in plant products particularly in cereal. Due to their high cytotoxic and immunosuppressive properties, the toxicological these toxins pose a risk to human and animal health. Accurate determination of the presence of toxin is of major importance to those monitoring the quality of feed and food in which DON may occur. We developed monoclonal antibody for DON, and a kit for detection of DON in cereal, feed with simple and easy procedure.

Features

The kit is for quantitative detection of DON in cereal and feed and has outstanding specificity and quantification. The detection procedure is simple, easy and hardly influenced by other protein components.

Specificities

The ELISA kit is specific for DON and 15-acetyl DON (see Basic capability).



Composition

- Antibody coated plate
- DON standard
- Enzyme conjugate solution
- Enzyme conjugate solution diluent
- Antibody solution
- Substrate for enzymes
- Stop solution
- Concentrated washing solution
- Plate cover

Assay Principle

The ELISA kit adopts direct competitive reaction recognizing DON and their derivatives. The capture antibody are coated on the surface of 96 well plate, onto which HRP-labeled DON, anti-DON antibody and DON standard solution or object to be measured are overlaid at once. After reaction, substrate is added to the wells, which reacts with the bound enzyme conjugate to produce blue color. The optical densities (OD) are measured and plotted the standard curve to calculate in the concentration of DON in the object to be measured.

Cross reactivity with mycotoxin of trichothecene

DON	100%

BroadCheck New Quinolone kit Ver.2.0

Background

Antibiotics have been widely used to reduce the bacterial infection, and continual administration of the antibiotics show increased survival of the bacteria. This phenomenon is of potential medical significance since tolerance causes failures and facilitates the development of antibiotic resistance. The antibiotics have also been used in stockbreeding and fisheries. The antibiotics remained in the meat and fish are ingested by human, and accelerate the development of antibiotic resistance. Among various antibiotics, new quinolones have broad antibiotic spectra and a wide variety of derivatives have been developed and used. Contamination of new quinolones offer problem. We developed monoclonal antibody for the wide variety of new quinolones, and a kit for simultaneous detection of various antibiotics remained in the meat and fish with simple and easy procedure.

Features

The kit is for quantitative detection of new quinolone and their derivatives in food, and has outstanding specificity and quantification. The detection procedure is simple, easy and har dly influenced by physiological active substances and body fluid components. Since the monoclonal antibody used in this kit is able to bind to the antigen in organic solvents (methanol and ethanol), the extract from tissues with alcoholic can immediately be measured with the ELISA.

Specificities

The ELISA kit is specific for new quinolones and their derivatives, and cross reacts with neither sulfa drugs nor nitrofurans (see Basic Capability).

Composition

- Antibody coated plate
- New quinolone standard
- Enzyme conjugate solution
- Enzyme conjugate solution diluent
- Antibody solution
- Substrate for enzymes
- Stop solution
- Concentrated washing solution
- Plate cover

Assay Principle

The ELISA kit adopts direct competitive reaction recognizing the basic component in common with new quinolones and their derivatives. The capture antibody are coated on the surface of 96 well plate, onto which HRP-labeled new quinolone, anti-new quinolone antibody and Enrofloxacin antibacterial agent or object to be measured are overlaid at once. Measuring HRP activity in the complex yields concentration of new quinolone in the object to be measured.

PVY-N ELISA HOKUDO

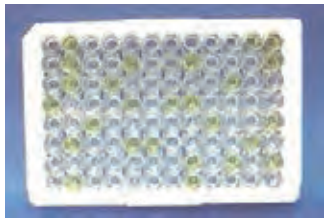
Intended Use

This kit detects PVY-N (potato Y virus N).

PVY-N (potato Y virus N) is a virus that causes the decrease in amount and the quality by infection with the seed potato in a vegetative propagation potato.

Composition

- Anti PVY IgG : 1 plate (96 wells)
- ALP labeled Anti PVY monoclonal antibody : 0.3 mℓ × 1
- homogenization buffer (phosphate-buffer, Tween 20) : 100 mℓ × 1 bottle
- reaction buffer (PBS, BSA, Tween 20) : 26 mℓ × 1 bottle
- Washing solution : 100 mℓ × 1 bottle
- enzyme-substrate solution (PNPP) : 26 mℓ × 1 bottle
- Stopping solution : 13 mℓ × 1 bottle
- positive control : 1 mℓ × 2 vials
- negative control : 1 mℓ × 2 vials
- Adhesive plate covers : 2 sheets



Assay result example

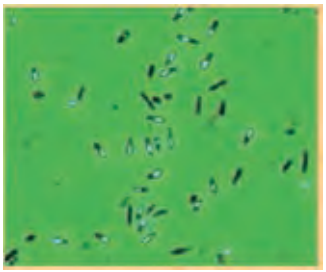
Guaiacol Detection Kit

Intended Use

Used together with VA-YSG Medium (Cat. No. KYO-08901) to determine the presence of guaiacol-producing Thermo-Acidophillic Bacilli (TAB) in juice.

Background

Alicyclobacillus acidoterrestris is a gram-positive, spore-forming bacillus that occurs widely in nature. This species have been studied substantially after the incident of turbidity of transparent apple juice in 1984. The Alicyclobacillus genus bacteria, which peculiarly grow under relatively high temperature and acid conditions, are called Thermo-acidophilic Bacilli (TAB) [1, 2, 3].
TAB are not destroyed by pasteurization and may remain in final products of fabricated food and beverages. TAB are not known to be harmful to health but are known to degrade the quality of juices and other products by producing guaiacol, causing off-flavor. Even without the off-flavor problem, product values may be degraded by slight deterioration during distribution.
It is very difficult to avoid contamination of TAB, which are common in soil. Fortunately, however, A. acidocaldarius and other main species that cause contamination are known to be harmless, and damage caused by TAB can be minimized by monitoring the contamination of A. acidoterrestris, which is known to be harmful. This species, however, cannot be detected by usual isolation culture methods because it grows only under acid and relatively high temperature conditions.
Because of frequent occurrence of fruit juice deterioration incidents in Europe and other regions, Japan Fruit Juice Association developed and publicized a unified test method for thermo-acidophilic bacilli in March 2003[4]. To alloweasy performance of this test method, we developed a test kit to differentiate A. acidoterrestris in terms of productivity of guaiacol, which causes off-flavor.



A. acidoterrestris
Kindly provided by Mr. K. Goto. (MITSUI NORIN CO.,LTD.)

Scheme of the unified test method for TAB

TAB test:
TAB are detected selectively by culturing in an acid medium (pH 3.7±1) at temperatures best suited for their growth.
A. acidoterrestris differentiation:
After the TAB test, A. acidoterrestris is differentiated from the other Alicyclobacillus species by using either of the following methods: 1) The differential growth temperature method, using differences in breeding ability at best suited temperatures, and 2)The peroxidase method, using tetraguaiacol production.
*This product adopts the peroxidase method to differentiate A.acidoterrestris from TAB. The method allows quick measurement of productivity of guaiacol, which causes off-flavor.
*Direct testing after the preliminary culture is also under consideration.

Composition

Reagent 1: 50 mM Potassium hydrogen phthalate Buffer 60 mℓ×2 bottles
Reagent 2: 1.3 % hydrogen peroxide solution 2.5 mℓ×1 tube
Reagent 3: Peroxidase-Phosphoric Acid Buffer 2.5 mℓ×1 tube
Positive Control: Guaiacole (1050 ppm) 2.5 mℓ×1 tube

Method

1. Take with single inoculation loop,10 μℓ ,of young colony that has been isolated on YSG agar plate and that has not formed spores. Suspend the colony in a tube of "Va-YSG medium (2 mℓ), " (≧1×10^8 cfu/ mℓ).
2. Incubate at 45 ± 1℃ for 3 hours.
3. Add 1.0 mℓ of Reagent1of "Guaiacole Detection Kit".
4. Add 20 μℓ of Reagent 2 of "Guaiacole Detection Kit".
5. Add 20 μℓ of Reagent 3 of "Guaiacole Detection Kit".
6. Mix well.
7. Let it stand for 5 - 10 minutes.
8. Check the color change of the solution.

*Readthe result within 10 minutes
*Blank (Negative Control)
Use "Va-YSG medium (2 mℓ)" that has not been inoculated and follow steps 2 - 8.
*Positive Control
Mix well 2 mℓ of distilled water and 100 μℓ of Positive Control. Follow steps 3 - 8.

Interpretationof Results

Darker brown than blank = Positive *If the color change is not significant and difficult to determine, retest with 24 hours incubation instead of 3 hours, step 2.
Same color as blank = Negative
Verify the test results by checking the reading of positive control; positive control result should have significantly darker brown than blank.

Handling instructions

<Example of Results>
Brown color indicates contamination of AAT
1. Negative Control
2. A. acidoterrestris B2067
3. A. acidoterrestris ATCC49025T
4. A. acidocaldarius ATCC27009T
5. A. acidocaldarius HP2
6. A. genomic sp. P2
7. A. genomic sp. DSM11983

Please dispose used medium after high pressure sterilization (121℃ for more than 30 min) with appropriatecare. Please strictly keep the storage condition (2 - 10℃ Celsiusand and dark place).
Expiration date : 12 month from date of manufactre.

Va-YSG Medium

Intended Use

Detection of guaiacol

Background

Alicyclobacillus acidoterrestris is a gram-positive, spore-forming bacillus that occurs widely in nature. This specie has been studied substantially after the incident of turbidity of transparent apple juice in 1984. The Alicyclobacillus genus bacteria, which peculiarly grows under relatively high temperatures and acid conditions, is called Thermo-acidophilic Bacilli (TAB) [1, 2, 3].
TAB are not destroyed by pasteurization and may remain in final products of fabricated food and beverages. TAB are not known to be harmful to health but are known to degrade the quality of juices and other products by producing guaiacol, causing off-flavor. Even without the off-flavor problem, product values may be degraded by slight deterioration during distribution.
It is very difficult to avoid contamination of TAB, which are common in soil. Fortunately, A. acidocaldarius and other main species that cause contamination are known to be harmless, and damage caused by TAB can be minimized by monitoring the contamination of A. acidoterrestris, which is known to be harmful. These species, however, cannot be detected by usual isolation culture methods as they grow only under acidic and relatively high temperature conditions. Because of frequent occurrence of fruit juice deterioration incidents in Europe and other regions, Japan Fruit Juice Association developed and publicized a unified test method for TAB in March 2003 [4]. To allow easy performance of this test, we developed a kit that differentiates A. acidoterrestris in terms of productivity of guaiacol, which causes off-flavor.

Composition

Va-YSG Medium (2 mℓ) 100 tubes
Vanillic acid added YSG medium for guaiacol formation 2 mℓ ×100 tubes

Weight

780 g

Size

18×18×11cm

Method

1. Take with single inoculation loop, 10 μℓ , of young colony that has been isolated on YSG agar plate and that has not formed spores. Suspend the colony in a tube of "Va-YSG medium (2 mℓ), " (≧1×10^8 cfu/ mℓ).
2. Incubate at 45 ± 1℃ for 3 hours.
3. Add 1.0 mℓ of Reagent 1 of "Guaiacol Detection Kit".
4. Add 20 μℓ of Reagent 2 of "Guaiacol Detection Kit.
5. Add 20μℓ of Reagent 3 of "Guaiacol Detection Kit.
6. Mix well.
7. Let it stand for 5 - 10 minutes.
8. Check the color change of the solution.

*Read the result within 10 minutes

*Blank (Negative Control) Use "Va-YSG medium (2 mℓ)" that has not been inoculated and follow steps 2 - 8.

*Positive Control
Mix well 2 mℓ of purified water and 100 μℓ of Positive Control. Follow steps 2 - 8.

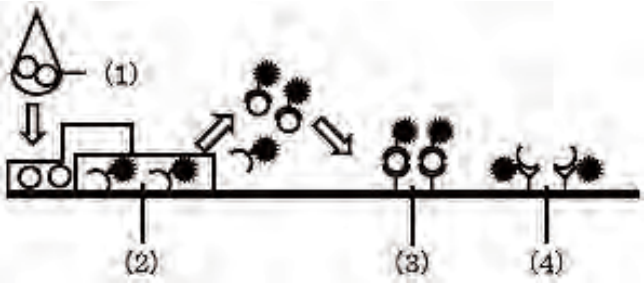
NH Immunochromato series

Intended Use

This kit is a simple and rapid detection kit for foodborne pathogens utilizing immunochromatographic assay. Simple test procedure with simply dropping specimens of enrichment culture to a test strip. Rapid judgment of test results, by checking the reddish purple test line simply after 15 minutes from the start of assay.

Background

Food poisoning by Diarrheagenic *Escherichia coli* is an infectious food poisoning that is caused by the growth of *E.coli* taken into the intestinal tract though the ingestion of food. These Diarrheagenic *E.coli* canbe broadly classified into five types[(1)]. Among these, Enterohemorrhagic *E.coli* (EHEC) causes hemorrhagic colitis through the action of the verotoxin that it produces; it can also cause hemolytic uremic syndrome and encephalopathy, which can be fatal. Many cases of mass food poisoning by EHEC have occurred, so EHEC is viewed as the most dangerous among Diarrheagenic *E.coli* from the standpoint of food hygiene. The recent increase in the serotype O26 isolated from patients with diarrheagenic *E.coli* infection has made it as the second commonest serotype after O157. The Ministry of Health, Labour, and Welfare of Japan therefore issued a notification of the "Test method of diarrheagenic *E.coli* O157 and O26" (Notification No. 1102004 issued by Inspection and Safety Division) in November 2006[(2)]#. This product is a kit for detecting *E.coli* O26 in foods by immunochromatography. Tests can be conducted rapidly and simply by means of the kit.



When a sample solution is dropped onto the test sample drop section of the test plate, the gold colloid-labeled anti-*E. coli* O157 polycolonal antibody (2) in the test sample-containing section dissolves and forms complexes with *E. coli* O157 (1). These complexes move to the expanded section by capillary attraction and are trapped by the anti-*E. coli* O157 antibody (3) that is fixed in the test line appearance position. This results in the appearance of a reddish purple line of gold colloid. This reddish purple line can be detected by visual inspection and used to judge the presence or absence of *E. coli* O157 in the test solution. The excess gold-labeled antibodies, regardless of the presence or absence of *E. coli* O157 in the test solution, travel further through the expanded section and are trapped by the anti-goat immunoglobulin rabbit antibody(4) fixed at the control line appearance position, where they form a second reddish purple line. The presence of this line indicates that the test solution has reached the expanded section.

Features

1. The simple one-step operation of the kit.
2. The test gives rapid results.
3. There is no need for special test equipment.

Composition

Test strip	2-test×10 packs
Instruction manual	1 sheet
Plastic pouched bag	1 bag

FASTKIT Slim series

Intended Use

Detection of allergic protein in foods or solutions

Background

The Japan Food Sanitation Law obliges that 7 specified allergenic ingredients (egg, milk, wheat, buckwheat, peanut, shrimp and crab), which have a high risk of inducing food allergy, should be listed on food labels. The Food Sanitation Law also recommends that 18 ingredients, including soybeans, should be listed on the label in a way similar to the specified allergenic ingredients.
"Providing accurate information by listing of ingredients on food labels" and "preventing contamination with the ingredients which are not listed on the labels" are required to prevent food allergy. Moreover, as a measure to prevent contamination, routine management at the manufacturing sites, including verification of the process of washing the machines and devices used for production, is important.
This product is a kit for detecting buckwheat protein by immunochromatography. Tests can be conducted rapidly and simply by means of the kit.

Features

1. The simple one-step operation enables easy assessment, and anybody can perform the test easily.
2. Because there is no need for special test equipment and the test gives rapid results (in 15 minutes), it is best for routine management at the production sites.

Human collagen type1 ELISA KIT

Intended Use

Type 1 collagen is the most abundant protein in connective tissues, especially in tendon, skin and bone. This kit is designed to quantify collagen in various sources such as cell media, ECM (Extra Cellular Matrix) of culture cells and tissues because the kit detects atelo-collagen which is prepared by pepsin digestion.

Features

Short assay time (2 hours 15 minutes).
Collagen pre-coated microtiter-plate.
Simultaneous assay of many samples (Assay maximum is 40 samples per 1 kit in duplicate).
No need of special machines and equipments because of non-isotope assay.
Partitional use because of split type (8 wells/strip).

Composition

- Collagen coated microtiter plate 96 wells : 12 strips
- Collagen standard : 0.5mℓ
- Biotinylated anti-collagen antibody concentrate : 0.8mℓ
- Avidin-HRP conjugate concentrate : 0.07mℓ
- Diluent A : 10mℓ
- Diluent B : 10mℓ
- Wash buffer concentrate (10X concentrated) : 50mℓ
- TMB substrate : 7mℓ
- Stop solution : 7mℓ
- Plate seal : 1 sheet

Description	Antigen	Immunogen	Reacts with	Applicable Sample	Sensitivity	Measurement Range	Supplementary	Cat. No.	Quantity

Cedar Pollen Allergen ELISA Kit

Intended to Use

For measurements of Cry j1 and Cry j2 in samples

Background

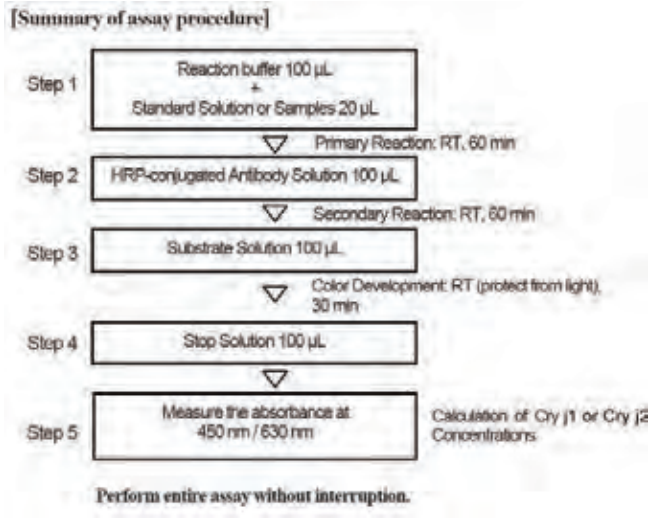
These sandwich-type enzyme-linked immunosorbent assay (ELISA) kits use the monoclonal antibodies specific to Cry j1 and Cry j2, the cedar (Cryptomeria japonica) pollen allergen.

Features

- Rapid: Handiling time is only 2.5 hours.
- High sensitivity: Cry j1 ≧0.8 ng/mℓ, Cry j2 ≧10 ng/mℓ
- Simple handling by sandwich EIA
- Special pretreatment is needless.

Composition Cryj1 (or Cryj2)

- Antibody-coated Microplate (8 well strip) : 12 strips
- Cry j1 (or Cryj2) Standard (dry form) (25.6 ng/mℓ) : 1 vial
- HRP-conjugated Antibody Solution : 1 vial (12 mℓ)
- Substrate Solution (TMB): 1 vial (12 mℓ)
- Stop Solution (1 mℓ/ℓ HCl) : 1 vial (12 mℓ)
- Standard Diluent : 1 vial (0.5 mℓ)
- Concentrated Reaction Buffer (5×) : 1 vial (40 mℓ)
- Concentrated Wash Solution (5×) : 2 vials (50 mℓ)
- Cover Film (for Microplate) : 3 films



Description	Antigen	Sensitivity	Supplementary	Cat. No.	Quantity
Cedar Pollen Allergen ELISA Kit "Cry j1"	Cry j1 (Cedar Pollen Allergen)	0.8 ng/mℓ	Sandwich	IIM-1Z31	1 kit
Cedar Pollen Allergen ELISA Kit "Cry j2"	Cry j2 (Cedar Pollen Allergen)	10 ng/mℓ	Sandwich	IIM-1Z32	1 kit

HAMA Blocker

Background

HAMA (Human anti-mouse antibody) interference is a common source of poor results in sandwich ELISA systems. This presents a significant problem, often causing false positive results in some assays.
THBR1-AS/THBR2 is a highly potent reagent that actively blocks the HAMA interference in sandwich ELISA assays.

Ig Class

IgG1

Composition

10 ㎎/㎖

Description	Cat. No.	Quantity
THBR1-AS	SIM-2ZTHBR1	2 ㎖
THBR2	SIM-2ZTHBR2	2 ㎖

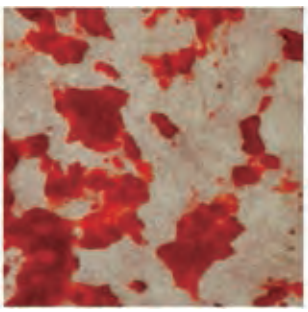
Calcification Evaluation Set

Intended Use

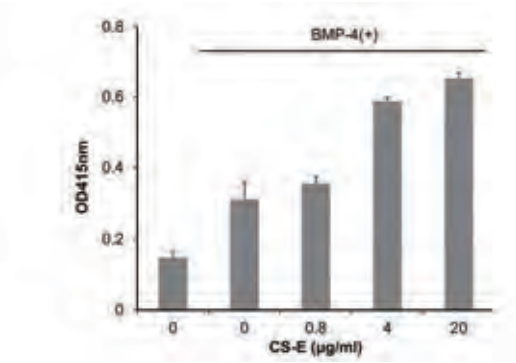
This product utilizes Alizarin Red dye solution to stain calcified nodules produced by differentiated osteoblasts, and an acid solution to extract dye bound to calcified nodules. The optical absorbance of the extracted dye solution is then measured, providing a convenient assay to evaluate the extent of osteoblast differentiation (calcification) in cultured cells.

Protocol

1. Remove culture medium from each well (24-well or 48-well plate), then once with PBS.
2. Fix washed cells with 10% neutral buffered formalin or 4% paraformaldehyed for app. 10 minutes.
3. Remove fixative solution and washwells with water.
4. Remove remaining water carefully by aspiration or by patting the plate on a paper towel.
5. Add Alizarin Red solution to each well (0.5㎖/well for 24-well plate or 0.25㎖/well for 48-well plate), and stain for 30 minutes at room temperature.
6. Remove the Alizarin Red solution in each well and wash with water until wash water is nearly clear (pale red color. Wash water will not clear completely).
7. Carefully remove all remaining water from wells by aspiration or by patting the plate on a paper towel.
8. Add Calcified Nodule Extraction Solution to each well (0.5 ㎖/well for 24-well plate or 0.25㎖/well for 48-well plate), and shake plate gently for about 10 minutes on a plate shaker to extract the bound dye.
9. Transfer 100㎕ of the extracted dye solution to 96-well plate and measure the absorbance at 400～450㎚ on a plate reader.



Alizarin Red staining of MC3T3-E1 cells cultured in differentiation medium



The Effects of BMP and chondroitin sulfate E (CS-E) on the mineralization of MC3T3-E1 cells (Mean±SD)

Cautions

1. When using this reagent set, take appropriate safety precautions (*i.e.*, lab coat, gloves, eye goggles, etc) to avoid contact with body.
2. If upper internal surface of culture wells are strongly stained by Alizarin Red due to non-specific calcium adherence, remove this red material using a cotton swab or other wipe prior to Step (8).
3. This reagent set is not suitable for use with calcium phosphate coated plates such as CSR-BRA-24P or CSR-BRA-48P.

EnBio RCAS for ER α

Intended Use

Screening of natural extracts and synthetic chemicals for potential nuclear receptor ligands.

Background

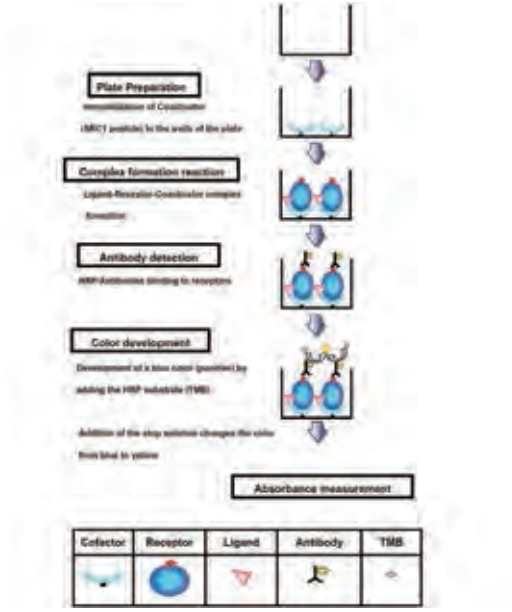
Estrogen receptor α (ERα) is a member of the nuclear receptor (NR) family. NR is one of the transcription factors that regulate target gene expression. ERα plays an important role of reproduction in physiological functions. The study of chemical binding to ERα is very useful for research of endocrine disrupting chemicals (EDCs) and drug screening.

NR activation before gene expression consists of 3 steps.
Step 1: Ligand binding to NR induces conformational change of NR
Step 2: Coactivator is recruited to NR-ligand complex
Step 3: Other transcriptional factors are recruited to NR-ligand-coactivator complex

Competitive binding assay detects only the ligand-binding to NR, whereas RCAS detects NR-ligand-coactivator complex. Therefore characteristic of the test samples can be predicted more accurately using this RCAS kit (*i.e.* both agonist and antagonist for ERα can be detected.).

Principle

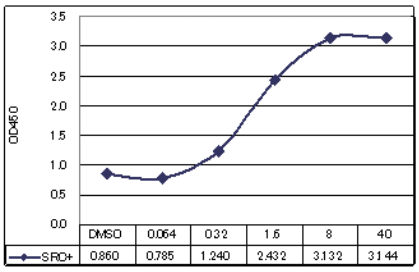
A peptide containing LXXLL motifof coactivator (SRC1) is immobilized on the microwell plate. The mixture of recombinant human ERα with potentially agonistic or antagonistic compounds is incubated into the plate. The binding of ERα-ligand complex to the coactivator peptide on the plate is detected by using HRP conjugated detection antibody.
The HRP activity is determined by the addition of TMB substrate solution. The reaction is stopped by addition of an acid solution and the resultant color is read at 450 nm using a microwell plate spectrophotometer. The reactivity of the sample to the receptor can be determined by calculation of EC50 or IC50 using the absorbance data.



Assay Principle

Composition

- Microtiter plate : 1 plate (12 wells×8 strips) (in a foil pouch)
- 100×SRC1 peptide : 1 tube (0.2 mℓ in 1.7 mℓ plastic tube)
- 100×Detection antibody <ERα> : 1 tube (0.14 mℓ in 1.7 mℓ plastic tube)
- Assay buffer : 1 bottle (30 mℓ in 30 mℓ PP bottle)
- 10×Wash buffer, phosphate : 1 bottle (50 mℓ in 60 mℓ PP bottle)
- TMB substrate : 1 bottle (25 mℓ)
- Stop solution (2.7% sulfuric acid) : 1 bottle (14 mℓ in 15 mℓ PP bottle)
- Dimethyl Sulfoxide (DMSO) : 1 vial (4 mℓ in 5 mℓ glass tube)
- ERα agonist α-Estradiol, 0.8 μM in DMSO : 1 vial (0.3 mℓ in 1.5 mℓ glass tube)
- Plate seal : 1 sheet
- ERα : 3 tubes (0.2 mℓ PCR tube)



A typical result obtained by using this kit
Actual Photograph of TMB color development in the wells just before adding the stop solution (the photograph was taken when the data described in panel A was measured.)

EnBio RCAS for LXR α

Intended Use

Screening of natural extracts and synthetic chemicals for potential nuclear receptor ligands.

Background

Liver X receptor (LXR) is a member of the nuclear receptor (NR) family. NR is one of the transcription factors that regulate target gene expression. LXR plays an important role in regulation of cholesterol and fatty acid homeostasis, therefore, the study of chemicals bind to LXR is very useful for research of drug screening.
LXR has two subtypes, LXR α and LXR β. LXR α is expressed in restricted tissues such as liver, kidney, intestine, fat tissue and macrophages,whereas LXR β is ubiquitously expressed.

NR activation before gene expressionconsists of 3 steps.
Step 1: Ligand binding to NR induces conformational change of NR
Step 2: Coactivator is recruited to NR-ligand complex
Step 3: Other transcriptional factors are recruited to NR-ligand-coactivator complex

Competitive binding assay detects only the ligand-binding to NR, whereas RCAS detects NR-ligand-coactivator complex. Therefore you can predict the characteristic of your test samples more accurately using this RCAS kit.

Principle

A peptide containing LXXLL motif of coactivator (SRC1) is immobilized on the microwell plate. The mixture of recombinant human LXR α with potentially agonistic compounds is incubated into the plate. The binding of LXR α-ligand complex to the coactivator peptide on the plate is detected by using HRP conjugated detection antibody. The HRP activity is determined by the addition of TMB substrate solution. The reaction is stopped by addition of an acid solution and the resultant color read at 450 nm using a microwell plate spectrophotometer. The reactivity of the sample to the receptor can be determined by calculation of EC50 using the absorbance data.

Composition

- Microtiter plate : 1 plate (12 wells×8 strips)
- 100×SRC1 peptide : 1 tube (0.2 mℓ)
- LXR α : 2 vials (lyophilized)
- 100×Detection antibody <LXR α> : 1 tube (0.14 mℓ)
- Assay buffer : 1 bottle (30 mℓ)
- 10×Wash buffer, phosphate : 1 bottle (50 mℓ)
- TMB substrate : 1 bottle (25 mℓ)
- Stop solution (2.7% sulfuric acid) : 1 bottle (14 mℓ)
- Dimethyl Sulfoxide (DMSO) : 1 vial (4 mℓ)
- LXR α agonist T0901317, 0.5 mM in DMSO : 1 vial (0.3 mℓ)
- Plate seal : 2 sheets

EnBio RCAS for PPAR α

Intended Use

Screening of natural extracts and synthetic chemicals for potential nuclear receptor ligands.

Background

Peroxisome proliferator activated receptor α (PPAR α) is a member of the nuclear receptor (NR) family. NR is one of the transcription factors that regulate target gene expression. PPAR α is expressed in restricted tissues such as liver, skeletal muscle. PPAR α plays an important role in regulation of lipid metabolism and is the main target of fibrate drugs used for the treatment of hyperlipidemia. Therefore, the study of chemicals bind to PPAR α is very useful for research of drug screening.

NR activation before gene expression consists of 3 steps.
Step 1: Ligand binding to NR induces conformational change of NR
Step 2: Coactivator is recruited to NR-ligand complex
Step 3: Other transcriptional factors are recruited to NR-ligand-coactivator complex

Competitive binding assay detects only the ligand-binding to NR, whereas RCAS detects NR-ligand-coactivator complex. Therefore you can predict the characteristic of your test samples more accurately using this RCAS kit (*i.e.* both agonist and antagonist for PPAR α can be detected).

Principle

A peptide containing LXXLL motif of coactivator (CBP) is immobilized on the microwell plate. The mixture of recombinant human PPAR α with potentially agonistic or antagonistic compounds is incubated into the plate. The binding of PPAR α-ligand complex to the coactivator peptide on the plate is detected by using HRP conjugated detection antibody.
The HRP activity is determined by theaddition of TMB substrate solution. The reaction is stopped by addition of an acid solution and the resultant color read at 450 nm using a microwell plate spectrophotometer. The reactivity of the sample to the receptor can be determined by calculation of EC50 using the absorbance data.

Composition

- Microtiter plate : 1 plate (12 wells×8 strips)
- 100×CBP peptide : 1 tube (0.2 mℓ)
- PPAR α : 2 vials (lyophilized)
- 100×Detection antibody <PPAR α> : 1 tube (0.14 mℓ)
- Assay buffer : 1 bottle (30 mℓ)
- 10×Wash buffer, phosphate : 1 bottle (50 mℓ)
- TMB substrate : 1 bottle (25 mℓ)

EnBio RCAS for PPAR δ

Intended Use

Screening of natural extracts and synthetic chemicals for potential nuclear receptor ligands.

Background

Peroxisome proliferator-activated receptor δ (PPAR δ) is a member of the nuclear receptor (NR) family. NR is one of the transcription factors that regulate target gene expression. PPAR δ plays an important role in regulation of fatty acid metabolism. PPAR δ is ubiquitously expressed and a potential target in treatment of obesity, insulin resistance and hyperlipidemia, therefore, the study of chemicals bind to PPAR δ is very useful for research of drug screening.

NR activation before gene expression consists of 3 steps.
Step 1: Ligand binding to NR induces conformational change of NR
Step 2: Coactivator is recruited to NR-ligand complex
Step 3: Other transcriptional factors are recruited to NR-ligand-coactivator complex

Competitive binding assay detects only the ligand-binding to NR, whereas RCAS detects NR-ligand-coactivator complex. Therefore you can predict the characteristic of your test samples more accurately using this RCAS kit (*i.e.* both agonist and antagonist for PPAR δ can be detected.)

Principle

A peptide containing LXXLL motif of coactivator (CBP) is immobilized on the microwell plate. The mixture of recombinant human PPAR δ with potentially agonistic or antagonistic compounds is incubated into the plate. The binding of PPAR δ-ligand complex to the coactivator peptide on the plate is detected by using HRP conjugated detection antibody.
The HRP activity is determined by the addition of TMB substratesolution. The reaction is stopped by addition of an acid solution and the resultant color read at 450 nm using a microwell plate spectrophotometer. The reactivity of the sample to the receptor can be determined by calculation of EC50 using the absorbance data.

Composition

- Microtiter plate : 1 plate (12 wells×8 strips)
- 100×CBP peptide : 1 tube (0.2 mℓ)
- PPAR δ : 2 vials (lyophilized)
- 100×Detection antibody <PPAR δ> : 1 tube (0.14 mℓ)
- Assay buffer : 1 bottle (30 mℓ)
- 10×Wash buffer, phosphate : 1 bottle (50 mℓ)
- TMB substrate : 1 bottle (25 mℓ)
- Stop solution (2.7% sulfuric acid) : 1 bottle (14 mℓ)
- Dimethyl Sulfoxide (DMSO) : 1 vial (4 mℓ)
- PPAR δ agonist L-165,041, 125 μM in DMSO : 1 vial (0.3 mℓ)
- Plate seal : 2 sheets

EnBio RCAS for PPAR γ

Intended Use

Screening of natural extracts and synthetic chemicals for potential nuclear receptor ligands.

Background

Peroxisome proliferator activated receptor γ (PPAR γ) is a member of the nuclear receptor (NR) family. NR is one of the transcription factors that regulate target gene expression. PPAR γ is highly expressed in adipocytes and regulates differentiation, adipose accumulation and insulin sensitivity. PPAR γ is the main target of thiazolidinedione (TDZ) class of drugs used for the treatment of type II diabetes. Therefore, the study of chemicals bind to PPAR γ isvery useful for research of drug screening.

NR activation before gene expression consists of 3 steps.
Step 1: Ligand binding to NR induces conformational change of NR
Step 2: Coactivator is recruited to NR-ligand complex
Step 3: Other transcriptional factors are recruited to NR-ligand-coactivator complex

Competitive binding assay detects only the ligand-binding to NR, whereas RCAS detects NR-ligand-coactivator complex. Therefore you can predict the characteristic of your test samples more accurately using this RCAS kit (*i.e.* both agonist and antagonist for PPAR γ can be detected.).

Principle

A peptide containing LXXLL motif of coactivator (CBP) is immobilized on the microwell plate. The mixture of recombinant human PPAR γ with potentially agonistic or antagonistic compounds is incubated into the plate. The binding of PPAR γ-ligand complex to the coactivator peptide on the plate is detected by using HRP conjugated detection antibody.
The HRP activity is determined by the addition of TMB substrate solution. The reaction is stopped by addition of an acid solution and the resultant color read at 450 nm using a microwell plate spectrophotometer. The reactivity of the sample to the receptor can be determined by calculation of EC50 using the absorbance data.

EnBio RCAS for VDR

Intended Use

Screening of natural extracts and synthetic chemicals for potential nuclear receptor ligands.

Background

Vitamin D receptor (VDR) is a member of the nuclear receptor (NR) family. NRs are ligand-activated transcription factors that regulate the expression of target genes by binding to cis-acting DNA sequences. VDR is activated by 1α,25(OH)2-VD3 (Vitamin D3) , the active form vitamin D and plays important role in regulation of calcium metabolism, immune responses and cancer by mediating the most biological functions of Vitamin D. Therefore, the VDR-specific ligands have been attractive targets for research of calcium metabolism and chronic disease such as osteoporosis, cancer and immune diseases.

NR activation before gene expression consists of 3 steps.
Step 1: Ligand binding to NR induces conformational change of NR
Step 2: Coactivator is recruited to NR-ligand complex
Step 3: Other transcriptional factors are recruited to NR-ligand-coactivator complex

Competitive binding assay detects only the ligand-binding to NR, whereas RCAS detects NR-ligand-coactivator complex. Therefore you can predict the ligand-dependent NR activity of your test samples more accurately using this RCAS kit.

Principle

A peptide containing LXXLL motif of coactivator (SRC1) is immobilized on the microwell plate. The mixture of recombinant human VDR with potentially agonistic compounds is incubated into the plate. The binding of VDR-ligand complex to the coactivator peptide on the plate is detected by using HRP conjugated detection antibody. The HRP activity is determined by the addition of TMB substrate solution. There action is stopped by addition of an acid solution and the resultant color read at 450 nm using a microwell plate spectrophotometer. The reactivity of the sample to the receptor can be determined by calculation of EC50 using the absorbance data.

Composition

- Microtiter plate : 1 plate (12 wells×8 strips)
- 100×SRC1 peptide : 1 tube (0.2 mℓ)
- 100×Detection antibody <VDR> : 1 tube (0.14 mℓ)
- Assay buffer : 1 bottle (30 mℓ)
- 10×Wash buffer, phosphate : 1 bottle (50 mℓ)
- TMB substrate : 1 bottle (25 mℓ)
- Stop solution : 1 bottle (2.7% sulfuric acid)(14 mℓ)
- Dimethyl Sulfoxide (DMSO) : 1 vial (4 mℓ)
- VDR agonist 1α,25(OH)2-VD3, 10μM in DMSO : 1 vial (0.3 mℓ)
- Plate seal : 1 sheet
- VDR : 3 tubes (0.2 mℓ PCR tube)

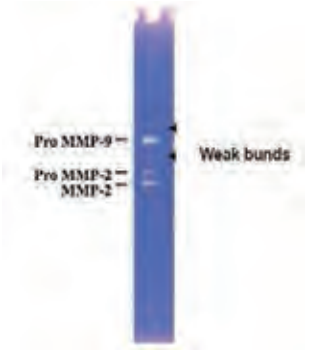
Gelatin Zymography kit

Intended Use

The Gelatin Zymography Kit provides an easy system for the electrophoretic detection of ProMMP-2, MMP-2 and ProMMP-9 in blood, body fluid, secretion, cell lysate, cell culture medium, and other samples.

Protocol

1. Load 100-150 mℓ of Electrophoresis Buffer to the lower chamber (anode). Refer to the instruction manual of your electrophoresis tank/chamber to know appropriate volume of the buffer.
2. Take out the comb on precast gel carefully and set the gel to electrophoresis chamber. The side of sample holes should be set on the upper side. If the sample holes are disturbed, fix them up with needle etc.
3. Load around 100 mℓ of Electrophoresis Buffer to the upper chamber (cathode).
4. Mix samples with equivalent volume of sample preparation buffer. Incubate for 15 minutes at Room Temperature. (Do NOT heat the samples.)
   *MMP markers can be used without sample preparation buffer.
5. Apply the samples and MMP markers to gel plate.
6. Run electrophoresis at 15 mA constant current. (If you use 2 gels, set the current at 30 mA)
7. After the run is completed, turn off the electrophoresis chamber, and take out the gel plate from the chamber.
8. Remove the upper glass plate of thegel plate and peel off the gel carefully with a spatula.
9. Put the gel in the tray with 200 mℓ of Washing Buffer. Incubate with shaking at Room Temperature.
10. Put the gel in the container with 50 mℓ of Reaction Buffer and seal up the container. Incubate the gel in the container in incubator at 37℃ for 20-40 hrs (Lower enzyme concentration needs longer reaction time.).
11. After enzymatic reaction, put the gel in the container with Staining solution. Incubate for 30 minutes at Room Temperature to stain protein.
12. Put the gel in the container with De-staining solution. And incubate for 30 minutes to several hours to de-stain.



10 μℓ of MMP markers applied and enzymatic reacted for 24 hr at 37℃

Albumin Glycation Assay Kit, Glyceraldehyde / Collagen Glycation Assay Kit, Glyceraldehyde

Intended Use

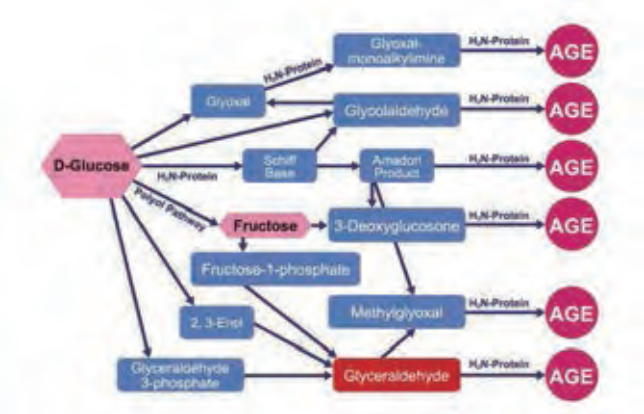
For the detection of fluorescent glyceraldehyde-derived advanced glycation end products (AGEs) that form rapidly on albumin or collagen, and for evaluating the ability of substance to inhibit the formation of fluorescent glyceraldehyde-derived AGEs on albumin or collagen.

Background

The non-enzymatic reaction of reducing carbohydrates with lysine side chains and N-terminal amino groups of macromolecules (proteins, phospholipids and nucleic acids) is called the Maillard reaction or glycation. The products of this process, termed advanced glycation end products (AGEs), adversely affect the functional properties of proteins. Many AGEs have fluorescent and convalent cross-linking properties. Accumulation of AGEs has been thought to play an important role in the pathogenesis of diabetic patients as well as the aging process.
Recent studies have suggested that AGEs can arise not only from sugars but also from carbonyl compounds derived from the autoxidation of sugars and other metabolic pathways. Among different AGEs, there is evidence that glyceraldehyde -derived AGEs are associated with such cytotoxcity.
"Albumin Glycation Assay Kit" provides rapid detection of fluorescent AGEs and inhibition assay for glycation of albumin solution by glyceraldehyde.
"Collagen Glycation Assay Kit, Glyceraldehyde" provides rapid detection of fluorescent AGEs and inhibition assay for glycation of collagen by glyceraldehyde. These kits provide sufficient reagents to perform up to 192 assays.
These availability and convenience of these Kits will contribute to functional foods or development of anti-glycation material in the cosmetic field.

Principle

These Albumin Glycation Assay Kits are a complete assay system designed to measure the fluorescent AGEs using the fluorescence microplate readerequipped with a 370nm excitation filter and 440nm emission filter.



Possible routes of the advanced glycation end-products (AGEs) formation

Albumin Glycation Assay Kit

Collagen Glycation Assay Kit

Composition

Albumin Glycation Assay Kit

- Bovine Serum Albumin (BSA) Solution
- glyceraldehyde (500mM)
- buffer solution
- Aminoguanidine solution (20mM)

*Anti glycation standard substance

Collagen Glycation Assay Kit

- Collagen Acidic Solution
- Neutralizing Solution
- Glyceraldehyde Solution (500mM)
- Sample Dilution Buffer
- Aminoguanidine Solution (20mM) : Positive control

Collagen Glycation Assay Kit, Glucose / Fructose

Intended Use

For detection of fluorescent advanced glycation endproducts (AGEs) that form on collagen in the presence of glucose and fructose, and for evaluating the ability of substances to inhibit the formation of fluorescent AGEs that form on the presence of glucose and fructose.

Background

The non-enzymatic reaction of reducing carbohydrates with lysine side chains and N-terminal amino groups of macromolecules (proteins, phospholipids, and nucleic acids) is called the Maillard reaction or glycation. This reaction is initiated by the nonenzymatic reaction of reducing sugars with free amino groups on proteins to form Amadori products. The Amadori products undergo a variety of irreversible dehydration and rearrangement reactions, leading to the formation of advanced glycation end products (AGEs). AGEs have adverse effects on the functional properties of proteins. Many AGEs have fluorescent and covalent cross-linking properties. The accumulation of AGEs is thought to play an important role in the pathogenesis of diabetic patients and the aging process.
The collagen that forms bone, skin, and blood vessel is also glycated.

Principle

The collagen gel formed in 96-well plates generates fluorescence after long-term incubation with glucose or fructose at 37℃. Some reagents or natural products inhibit this reaction. The Collagen Glycation Assay Kit, Glucose / Fructose is a complete assay system, which is designed to measure fluorescent AGEs using a fluorescence micro plate reader equipped with a 370 nm excitation filter and a 440 nm emission filter.

Composition

- Collagen Acidic Solution : 5 mℓ
- Neutralizing Solution : 5 mℓ
- Glucose Solution (200 mM) : 10 mℓ
- Fructose Solution (200 mM), 10 mℓ Sample Dilution Buffer : 20 mℓ
- Aminoguanidine Solution (20 mM): Positive Control : 0.1 mℓ

HCV Genotype Primer Kit

Intended Use

This kit determines HCV genotypes by simply electrophoresing HCV core region genes of type-specific sequence length amplified by Reverse-Transcription Polymerase Reaction (RT-PCR) and features accurate and simple determination of HCV genotypes.

Background

Study of nucleotide sequence of hepatitis C virus (HCV) has brought to light many of its variants, and reports on its grouping in 5 major genotypes as determined by respective genomic sequences in a fairly well conserved portion as well as geographic locality of each subtype have subsequently been made. Genotyping of HCV is now considered to be clinically helpful in pinning and tracking down the source and route of its infection and will be instrumental in further elucidation of the virus.
Recent report also suggests difference in resistance against therapy and course of the disease of each viral subtype predicting the therapeutic significance of its genotyping.
This kit is developed for genotyping HCV in 5 groups, types I(1a), II (1b), III (2a), IV (2b), and V (3a), determined by Okamoto, *et al* according to genomic sequences in its core region.

Features

This kit determines HCV genotypes by simply electrophoresing HCV core region genes of type-specific sequencelength amplified by Reverse-Transcription Polymerase Reaction (RT-PCR) and features accurate and simple determination of HCV genotypes.

Pio Assay P. aeruginosa kit

Intended Use

Pseudomonas aeruginosa detection kit using slide agglutination method by monoclonal antibody for O-antigen of *Pseudomonas aeruginosa*.

Composition

- Anti *Pseudomonas aeruginosa* antibody solution, 14 bottles (A-N, 2 mℓ each)
- Antibody mixture, 3 bottles (Antibody mixture 1: A, C, H, I, L;
- Antibody mixture 2: B, J, K, M; Antibody mixture 3: D, E, F, G, N; 2 mℓ each)

Description	Cat. No.	Quantity
Pio Assay P.aeruginosa kit	NBT-POA-1	14 pc

NH beads series

Intended Use

Separation reagent for *E. coli* O26 after enrichment culture

Background

It is difficult that separation of O26 from sample with direct method due to existence of contaminants. This product enable to separate O26 effectively with immunomagnetic beads.

Composition

- NH beads (500 μℓ (25 tests)), 1 tube

Description	Cat. No.	Quantity
NH beads : O26	NPH-B00026	25 test
NH beads : O111	NPH-B00111	25 test
NH beads : O157	NPH-B00157	25 test

Acidic Mucopolysaccaride Assay Kit

Intended Use

Measurement kit for acid mucopolysaccharide in chondrocytes

Background

Chondrocytes produce extracellular matrix such as collagen, mucopolysaccharide and so on. There are conventional methods to measure acidic mucopolysaccharides using radioisotopes but the area and the amount used regarding radioisotopes are restricted. On the other hand, HPLC analysis is complicated to maintain the system and to extra for making samples. Acidic Mucopolysaccharide Assay Kit (PMC-AK03-COS) provides a convenient system for mucopolysaccharides visualization using Stains All, which combines with acidic mucopolysaccharides, with ease. Stains All normally combines with acidic substance, however the Stains All in this kit stains only acidic mucopolysaccharides of chondrocytes selectively.

Composition

- Chromogenic Solution (4 mℓ)×1 bottle
- Buffer (130 mℓ)×1 bottle
- Enzyme Powder for Sample Preparation×5 bottles
- Chondroitin Sulfate Standard Solution (100 μg/mℓ) (2 mℓ)×1 bottle

Reference

- Obayashi K. *et al.*, Am. J. Vet. Res. 72 194-202 (2011)

Fecal Mucin Assay Kit

Background

Mucins are a family of heavily glycosylated proteins, and main components of mucosa such as saliva, tear, gastric fluid enteric fluid. Basic configuration of mucin are a macromolecules linked ramiform sugar chain to peptide framework. The heterogeneous property of sugar chain makes them diversity, the molecules has various function, such as specific molecular recognition. Some of the sugar chains recognize a specific protein derived from virus, bacteria was found. Mucins are positioned in mucosal barrier function in gut, stopping the translocation of pathogen and toxin into blood vessel beyond the intestinal wall.
This kit is useful for determination of mucin content in feces.

Assay principle

Mucins are a family of high molecular (1,000kda-10,000kda) and heavily glycosylated protein. Mucin domains within the protein core are rich in threonine, serine and hydroxyproline, reducing end of sugar chain (GalNAc) are frequentry-linked to these amino acid by the post-translational O-glycosylation. This kit contains components to determine fecal mucin content.

Step1: Extraction and partial purification of mucin from feces.
Step2: Determination of mucin

O-glycosidically linked oligosaccharide chains is β-eliminated by diluted alkali, and reducing end of sugar chain is formed. Reducing carbohydrates react at high temperature with 2-cyanoacetamide (CAN) to produce intensity fluorescent condensate.

Composition

- Buffer solution A (tablet) : 3×100 mℓ
- Buffer solution B (acetic acid) : 1×25 mℓ
- Buffer solution C (boric acid) : 1×25 mℓ
- Reagent A (2-cyano acetamide) : 1×1.0 mℓ
- Reagent B (NaOH) : 2×1.5 mℓ
- Standard solution (250 μg/mℓ, N-acetylgalactosamine) : 1×1.0 mℓ
- Enzyme solution : 1×1.5 mℓ

Description	Cat. No.	Quantity

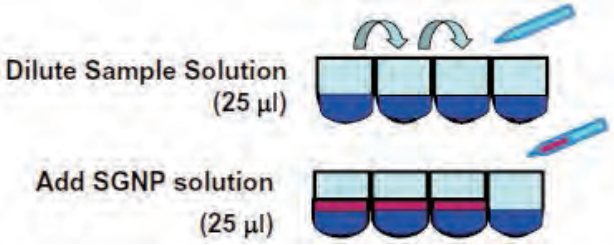
SGNP series - Sugar chain Gold Nano-Particles

Application#1: Aggregation assay of protein(s)

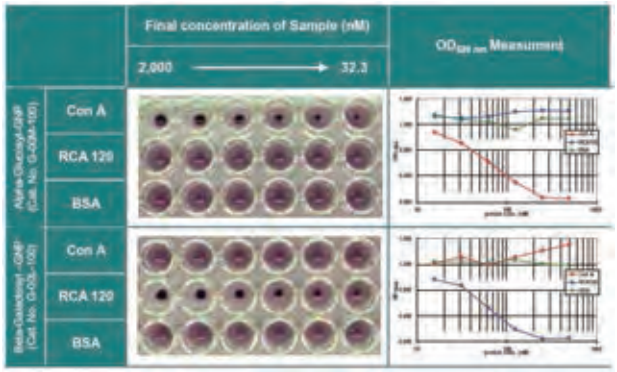
Regularly sugar chain binding proteins, such as lectins, possess multiple binding sites for sugar chains. By the addition of SGNP to the protein solution, the protein may form aggregates with sugar chains immobilized SGNP in a short time of period. The change can be seen visually, or can be quantified by measuring OD at around 530 nm. Using SGNP, the binding properties (selectivity, dissociation constant (K_D), specificity, etc.) are easily evaluated.

(Recommended protocol)



1. Dissolved SGNP at Abs_{530nm} 3.0 using your buffer.
2. In wells of 96-well microtiter plate (round bottom), 25 µℓ of protein solution was added with changing the concentration.
3. Addition of 25 µℓ of SGNP solution prepared as above. Gentle agitation for 0.5 to 2 hr at room temperature.
4. Measure OD at 530 nm of the supernatant.

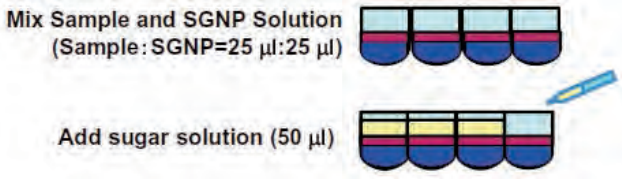
(Example)



Application#2: Inhibition assay

This assay is useful to know the specificity of the ligands for the target protein. By the addition of inhibitor (mono-saccharide, oligo-saccharide, mimetic compounds, glycoprotein, or drug candidate), the formed protein-SGNP aggregates may be re-dissolved by the competitive binding of protein with the inhibitor.

(Recommended protocol)

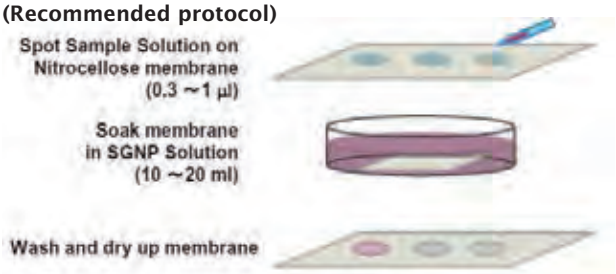


1. Dissolve SGNP at Abs_{530nm} 4.0 - 6.0 using your buffer
2. In wells of 96-well microtiter plate (round bottom), 25Pl of protein solution (Conc. > K_D) and 25 µℓ of SGNP solution as prepared above were added.
3. 50 µℓ of the inhibitor dissolved in the same buffer (conc. 0.1 - 50 mM) is added to the above mixture. Then, agitate for 1 hr or overnight.
4. Measure OD at 530 nm of the supernatant.

Application#3: Probe for Dot-Blotting assay

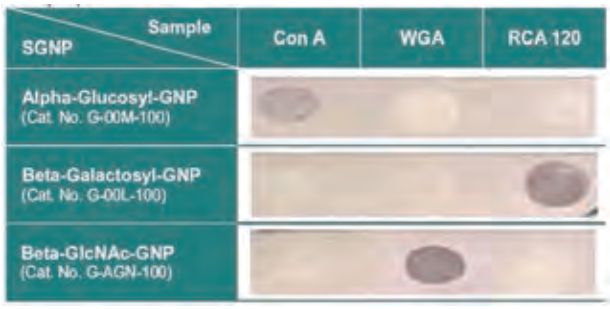
The sugar chain binding potency of the trace amount of your samples can be detected.

(Recommended protocol)



1. Prepare 10 - 20mℓ SGNP solution of Abs_{530nm} = 0.15 - 0.30 using your buffer.
2. On nitrocellulose membrane (10×30 mm), spot your sample (0.3 - 1µℓ, 0.1 - 2.0µg) and dry up at room temperature.
3. To 10 mℓ of SGNP solution in a glassware (φ 50 mm), the membrane is soaked with a gentle agitation for 5 - 30 min.
4. Wash the membrane with buffer and dry up.

(Example)



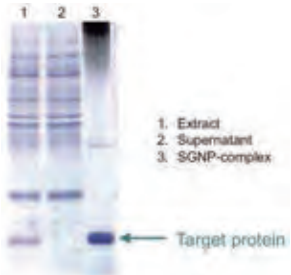
Application#4: Isolation and identification of target protein from a crude extract

Quick isolation and identification of protein(s) having multi-binding sites (lectin) from a plant-derived crude extract of cell-lysate are available using SGNP. Once you get an aggregate by mixing appropriate SGNP with your extract or lysate, the aggregate can be directly applied for SDS-PAGE. Then, the protein band(s) in SDS-gel is analyzed according to the proteomics procedure.

(Recommended protocol)

1. Dissolve SGNP at Abs_{530nm} = 3.0 using your buffer
2. To 50 Pl of SGNP solution in a 1.5 mℓ of eppendorf tube, add 50 µℓ of your extract. The mixture is incubated for 1 h to overnight at 4 degree C with a gentle agitation.
3. Centrifugation at 6,000 - 10,000× g for 10 min, and remove the supernatant.
4. To the precipitate, add 500 µℓ of buffer, vortex for 10 sec and centrifuge at 6,000 - 10,000× g for 10 min, and remove the supernatant. This may repeat 2 more times.
5. To the precipitate, add 10-30 Pl of sample preparation buffer, boiled up for 10 min.
6. SDS-PAGE

(Example)



Tel: +81-(0)3-5632-9617 Fax: +81-(0)3-5632-9618

Intended Use

SGNP (Sugar chain - immobilized Gold Nano-Particle) are gold nano particles immobilized with structurally defined sugar chains, showing red-purple color (Omax = ca. 530 nm). SGNP is a very convenient tool for evaluating sugar chain - protein interaction, since the interaction can be detected visually, and can be quantified from the change of OD at 530 nm.

There are several applications as follows:
1. Aggregation of protein
2. Inhibition assay
3. Dot-blotting
4. Isolation and purification of lectin from a crude extract freeze-drying, Abs530 nm =3.0 (dissolved in 0.25 mℓ of buffer)

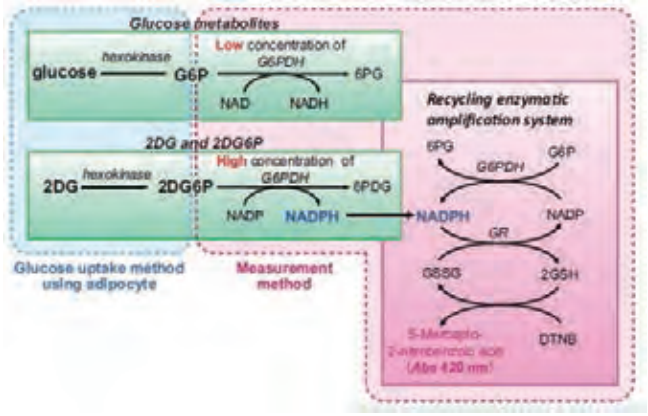
2DG uptake measurement kit - Glucose Uptake Assay

Intended Use

Direct measurement of glucose uptake without the use of radioisotopes.

Background

Measurement of 2-deoxyglucose (2DG) uptake in tissues and cells is a reliable approach with which to estimate glucose uptake and thereby to explore the regulation of glucose metabolism and mechanism of insulin resistance. Radioisotope-labeled 2DG is usually used for the measurement of 2DG uptake both *in vivo* and *in vitro*. However the radioisotope (RI) method is required a specialized facility for RI in strict limitation and cannot be handled in ordinal laboratories. Furthermore, radioactive 2DG administered into cultured cells remains in the extracellular space, and therefore the results must be corrected by separating the extracellular 2DG and intracellular 2DG/2DG-6-phosphate (2DG6P) in the cells. This kit is based on the enzymatic method for the direct measurement of 2DG6P amount without any use of radioisotope materials (Saito K and Minokoshi Y, *et al*. Analytical Biochem 412: 9-17, 2011).



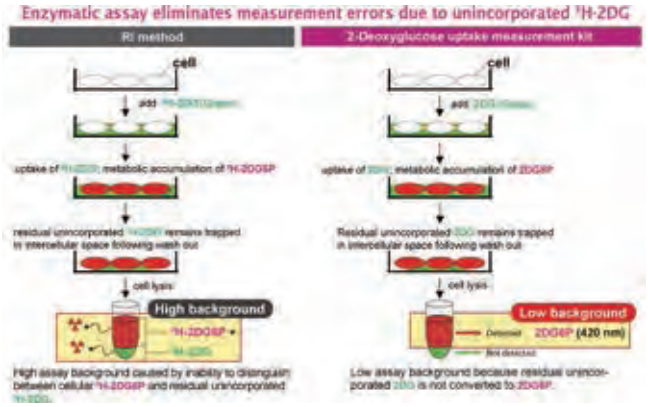
A recycling enzymatic amplification system measures NADPH produced by the *in vitro* oxidation of 2DG6P accumulated in cells following 2DG uptake.

1) So as not to effect glucose metabolism, only a small amount of 2DG is added to live cells. Incorporated 2DG is converted by cell metabolism to 2D6GP, which accumulates in cells. Cell lysates are then prepared.
2) To eliminate detection of G6P, G6P is oxidized (to 6PG) with NAD+ and a low concentration of G6PDH.
3) 2DG6P levels are quantitated by measuring the amount of NADPH produced during 2DG6P oxidation (with NADP+ and a high concentration of G6PDH) in a phtometric recycling amplification/detection system

All reaction steps are conveniently performed in a single well by the sequential addition of premixed reagents. Ideal for assay automation

Advantages

1. No RI materials are required, and 2DG uptake can be measured in any ordinal laboratories.
2. Direct measurement of 2DG6P amount accumulated in target cells.
3. High sensitivity with the use of enzyme-recycling amplification reaction.



Comparison between this kit and RI method

Adipocyte Fluorescent Staining Kit

Intended Use

Detection of Adipose Differentiation

Background

The Adipocyte Fluorescent Staining Kit is designed to stain both lipid droplets and nuclei in adipocytes using BODIPY(R) (Invitrogen Corporation) and H33258, respectively. Furthermore, the amount of lipid per cell and cellshape can bequantified using imaging instrument such as IN Cell Analyzer 1000 (GE Healthcare Company)
(*) BODIPY is a registered trademark of Invitrogen Corporation.

Composition

- PBS tablet for washing×5 tablets
- Nuclear stain solution (Hoechst33258) (50 mℓ)×1 bottle
- Lipid droplet stain solution (BODIPY®) (50 mℓ)×1 bottle
- Mounting Reagent (50 mℓ)×1 bottle

Additional Materials Required

- Fixative solution
- 37 % formaldehyde 100 mℓ
- Distilled or deionized water 900 mℓ
- NaH2PO4(H2O) 4 g
- Na2HPO4 6.5 g

GPDH Assay Kit

Intended Use

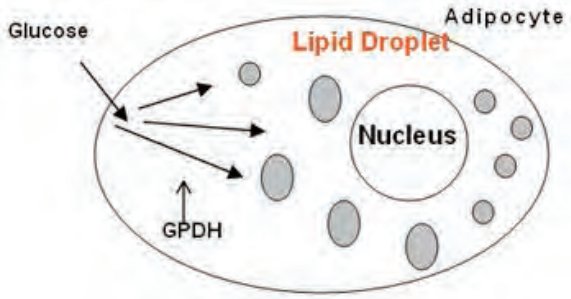
Measure GPDH activity in cells and tissue. Monitor fat synthesis and adipocyte differentiation.

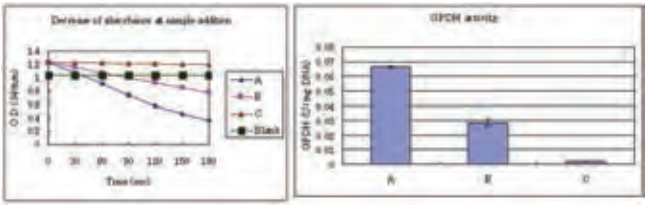
Background

The adipose tissue works as a place energy store *in vivo*. The way to do that is turning the energy derived from foods into fat by enzymes has a role in fat synthesis. Among the enzymes, glycerol 3-phosphate dehydrogenase (GPDH) is mostmeasured enzyme that to analyze fat synthesis activity of adipose tissue and adipocyte. This kit has several advantages, in measuring the enzyme activity, over the traditional methods, which include higher stability and reproducibility.

Composition

- Substrate×10 bottles (10 tests / bottle)
- Enzyme Extraction Reagent×1 bag (Powder)





< Example Data >
Effect of Troglitazone on GPDH activity in 3T3-L1 cell cultures
GPDH activities were measured with GPDH Assay Kit.
A, 3T3-L1 adipocytes treated with Troglitazone
B, 3T3-L1 adipocytes
C, 3T3-L1 preadipocytes

Protocol

Sample preparation - cultured cells

1. Remove culture medium and wash the cells twice with 500 μℓ PBS.
2. Add enzyme extraction solution to each well. For a 24-well plate, apply 0.5-1 mℓ per well.
3. Homogenize the cell extract byusing a sonicator.

Assay procedure

1. Add 400 μℓ of substrate solution to spectrometer cuvette (quartz micro cuvette), and warm at 25℃ (about 5 minutes). Hopefully use spectrometer keep warm at 25℃. When couldn't, wait until substrate solutionbecome room temperature. In same way, warm samples at 25℃.
2. Add 200 μℓ of sample to cuvette and mix it well. Measure decrease of absorbance at 340 nm, and find amount of absorbance change per minute (δO.D.). Use kinetic program on spectrometer. If don't have it, time measurement with timer. In general, measure for 3-10 minutes.
   Note 1: As described in example data, find slope (δO.D.) on linearity area.
   Note 2: It is possible to measure for a maximum of 500 samples, if use 96 well micro-plates reader.

Calculation of GPDH activity

One unit is activity of 1 μmol NADH example by GPDH per minute per 1 mℓ sample. Based on this, GPDH activity is found following equation. (Only light path is 1 cm)

GPDH activity (U/ mℓ)= δO.D.(340 nm)/min.×0.482*
(δO.D.: value of absorbance change at 340 nm)

*96well plate
Light path (cm) = total amount of reaction (mℓ) /area of the bottom of well (cm²)

Lipid Assay Kit

Intended Use

Detection of Adipocyte Differentiation

Background

Adipocytes synthesize neutral fat and accumulate it as fat globules in the cell during the development from precursor cells to mature adipocytes. The fat globules can be an indicator of the differentiation status of adipocytes.
This kit is a staining kit for fat globules in the adipocyte by Oil red O. Moreover, red-stained fat globules can be isolated and measured with determination of pigment.

Hybri-Bag

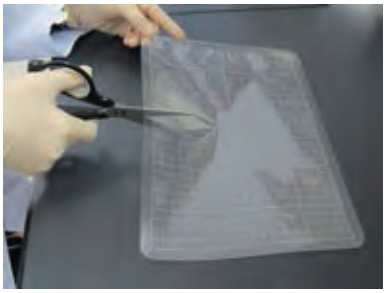
Intended Use

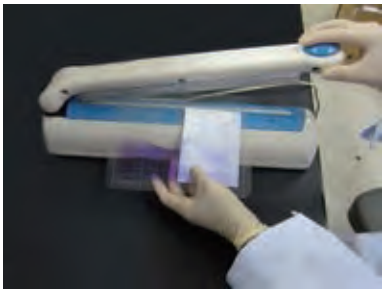
Laboratory-proposed heat-sealable bags for blotting and hybridization procedures.

Features

- High Strength (0 to +80℃) Composite Film
- Easy to seal with a Heat Sealer
- No Non-specific Binding (Non Powder product)
- Clear and Smooth surface
- Reasonable Price
- 3 types

Type	Soft	Hard	Hard (Grid type)
Cat.#	SE-S-1021-EX	SE-S-1001-EX	SE-S-1002-EX
Inside	Polyethylene	Polypropylene	
Outside	Nylon		
Size	200 × 200 (mm)		
Quantity	50 Bags		





1. Cut the Hybri-bag to adjust the size to the membrane.
2. Put membrane and buffer including antibody into the Hybri-bag, and seal with a heat sealer. (Note that you need to remove the bubbles from the hybri-bag when you seal to perform even blocking.)

PerfectHyb™ Hybridization Solution

Intended Use

Premixed hybridization solution containing a hybridization enhancer for Northern and Southern analysis.

Background

PerfectHyb™ Hybridization Solution is a premixed buffer for hybridization. It has the following characteristics.
PerfectHyb™ Hybridization Solution is a premixed buffer for hybridization. It has the following characteristics.

- Supports Northern and Southern blotting
- Hybridization time can be cut
- Allows analysis with both RI- and non-RI-labeled probes
- Optimum buffer for analysis using a hybridization oven, as the temperature for hybridization is equal to that for probe cleaning
- No need to add salmon sperm DNA, etc.
- Low viscosity makes handling easy

Applications

1. Northern blotting

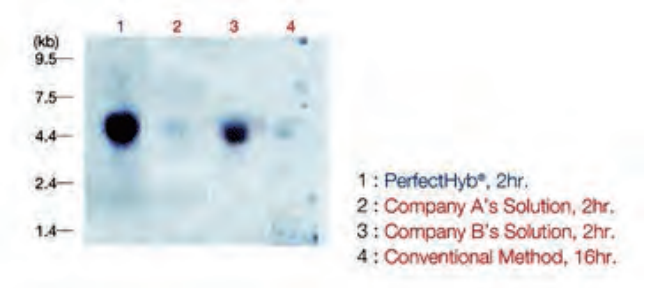
This product supports analysis using DNA probes, RNA probes and oligonucleotide probes. When used for pre-blotted type membrane*analysis, we recommend use of RI-labeled cDNA or oligonucleotide probes, taking into account background, rehybridization, etc.
Non-RI-labeled probes sometimes produce background signals depending on detection conditions. Experiments using such probes need to be done carefully, referring to the relevant instruction manuals.
* Good results have been obtained in analysis involving several manufacturers' preblotted membranes.

2. Southern blotting

We recommend use of DNA probes and oligonucleotide probes when using this product in Southern blotting.
Non-RI-labeled probes sometimes produce background signals depending on detection conditions. Experiments using such probes need to be done carefully, referring to the relevant instruction manuals.

3. Hybridization enhancement

This product contains a hybridization enhancer, which allows for shortened hybridization. When used in Northern blotting, this product enhances signals compared to conventional methods.



Northern Blot Analysis Using PefectHyb

Additional material required

The following are required to perform hybridization experiments using this product.
Reagents

- Cleanser A:2 × SSC (pH 7.0), 0.1% SDS
- Cleanser B*:0.1 × SSC (pH 7.0), 0.1% SDS

* Only necessary for Southern blotting or Northern blotting with RNA probes (cf. p.8 for details of reagent preparation)

Other equipment

- Thermostat (preferably with a shaking function) or a hybridization oven
- Heat sealer (unnecessary when an oven is used)
- Hybridization bag (unnecessary when an oven is used)
- X-ray film

Features and advantages

High Sensitivity

This solution contains a hybridization enhancer and generates a strong signal, enabling it effective detection of genes with low expression rates.

Optimize Performance of a Broad Range of Applications.

This solution can be used in Northern and Southern blot analysis. It is also ideal for non-RI analysis.

Rapid

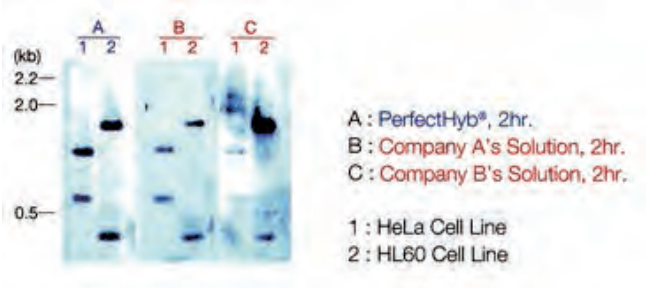
Normal hybridization can be completed in 1-2 hours.

Easy to use

This solution does not develop crystal precipitation and has a low viscosity at normal temperatures, allowing simple handling. Addition of salmon sperm DNA is also not necessary. Moreover, it allows hybridization and washing procedures at the same temperature and is ideal for analysis using hybridization ovens.

Recommendations

Use for the mRNA Blotting Membrane
We recommend that RI-labeled cDNA probes or oligo probes be used in analysis of pre-blotting membranes in consideration of background.
Detection of the Gene Navigator® cDNA Array System cDNA array
Use of PefectHyb® Hybridization Solution -filter array- is recommended for detection of the above-mentioned product.



Southern Blot Using PefectHyb

Description	Cat. No.	Quantity
PerfectHyb Hybridization Solution	TYB-HYB-101	250 ml

IMMUNO SHOT series

Background

IMMUNO SHOT is an enhancer of antigen-antibody reaction. In Western blotting and ELISA, researchers often experience a weak signal or high background. IMMUNO SHOT improves these problems it as antibody diluents. Due to the principle of working mechanism, IMMUNO SHOT can be used in many assay systems that use antigen-antibody reaction.

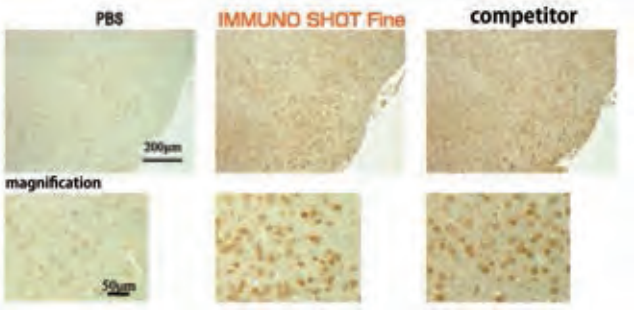
How IMMUNO SHOT Works
IMMUNO SHOT contains a polymer which, by changing the physicochemical properties of antigen and antibody, enhances the mutual accessibility, and facilitate the specific reaction. The other ingredient, protein, reduces non-specific binding of antibody. Thus, IMMUNO SHOT enhances the antigen-antibody reaction while reducing the background.

Applications

- IMMUNO SHOT is consisted of Reagent 1 and Reagent 2. Use Reagent 1 for the dilution of the 1st antibody. Use Reagent 2 for the dilution of the 2nd antibody. No change is required for the other assay protocol.

- In some assay systems, only one antibodyis used. Forexample some ELISA uses only one enzyme-conjugated antibody. In such case, try using Reagent 2 for the antibody dilution.In some cases, however, Reagent 1 gives better results.

- IMMUNO SHOT has been successfully used in Western blotting, antibody sandwich ELISA with either the 1st or 2nd antibody-labeled type, antigen sandwich ELISA



Staining of Cdk4 in mouse brain tissue

Staining of p53 in A431 cells

Staining of Vimentine in A549 cells

Features and Advantages

1. High signal with low background
IMMUNO SHOT enhances the antigen-antibody reaction. Comparing with the method using detergent-containing buffer, several to over 10-fold stronger signal can be obtained while the background level is low. Thus, you can get much higher S/N ratio than usual method.

2. Effective for saving antibody usage and time of reaction time
Because higher signal can be obtained using IMMUNO SHOT, you can reduce the amount of antibody used and the time required for reactions.

3. Can be used for many reactions
IMMUNO SHOT can be used not only for Western blotting and ELISA, but also forother assay systems using antigen-antibody reactions. In addition, IMMUNO SHOT does not affect activities of HRP (horse radish peroxidase) or AP (alkaline phosphatase), and can be used for assay systems using these enzymes.

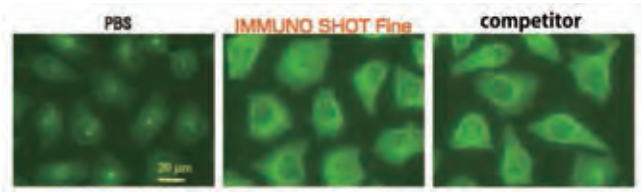
4. Easy to use IMMUNO SHOT is formulated as to Ready-to-Use.
Just exchange your dilution buffer of antibodies to the solutions of IMMUNO SHOT.

Characteristics of Composition

Solution F:
The solution is designed to maximize the background-reducing activity. Ideal for observing fine structures by using antibodies with high specificity and sensitivity.

Solution M:
The solution shows characteristics of middle of F and S. Ideal for initial try.

Solution S:
The solution is designed to maximize the specific signal enhancing activity. Ideal for observing strong signal by using antibodies with less specificity and sensitivity. This solution has less ability to reduce the background.
(Caution: the above description shows general characteristics of the solutions, and the results you get may be different depending on the antibody and antigen you are interested in.)



Staining of α-Tubulin in A549 cells

Staining of dimethyl histone in rat brain

IMMUNO SHOT Immunostaining family has following products.

Product #	Composition	Content
CSR-IS-SMF-10	Set of Solutions F, M, and S	10 ml each
CSR-IS-F-20	Solution F	20ml
CSR-IS-M-20	Solution M	20 ml
CSR-IS-S-20	Solution S	20 ml

For beginner user, we recommend to purchase CSR-IS as the initial try

IMMUNO SHOT Platinum -100% Protein Free ingredient-

Intended Use

An antigen-antibody reaction promotion reagent improving lack of western blotting and ELISA sensitivity and a high background. These products are made of 100% chemical ingredient and are designed to use various immunity assays system when you do not want to put the detection of the phosphorylation protein and other protein in reaction system.

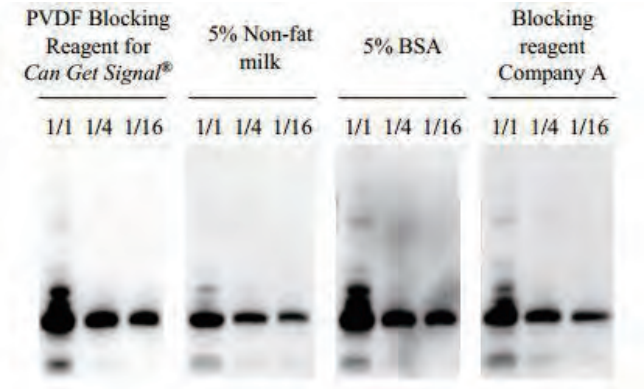
PVDF Blocking Reagent for Can Get Signal

Intended Use

High-performance blocking reagent for western blotting

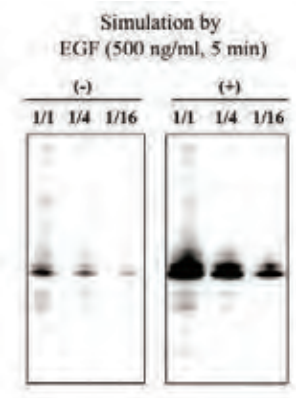
PVDF Blocking Reagent for Can Get Signal® is a high performance blocking reagent optimized for Western blot. The reagent consists of a synthesized polymer, with no protein components. The reagent can be used efficiently with Can Get Signal® Immunoreaction Enhancer Solution



PVDF Blocking Reagent for Can Get SignalR successfully increased protein signal intensity and reduced non-specific background staining.
<Assay conditions>
SDS-PAGE: 8-16% polyacrylamide gel, 15 mA × 90 min
Transfer: 0.8 mA/cm²
at RT for 60 min (semi-dry method)
Blocking: RT for 60 min
Sample: HeLa cell lysates 2 × 104
cells/well (1/1), 4n
dilution (1/4, 1/16)
Primary antibody: rabbit anti-ERK2 (C-14) antibody (0.1 ng/μℓ) in Can Get SignalR Solution 1
Secondary antibody: HRP-conjugated anti-rabbit IgG antibody (0.02 ng/μℓ) in Can Get SignalR Solution 2
Detection reagent: ECL Plus (GE Healthcare)

Features and Advantages

- PVDF Blocking Reagent for Can Get SignalR has been optimized for use together with Can Get SignalR Immunoreaction Enhancer Solution (Code No. NKB-101) for Western blot analysis.
- The reagent is suitable for detection of phosphorylated proteins, because it does not contain any protein components.
- The reagent minimizes the masking effects of low signal intensities, whereas conventional blocking reagents (e.g., non-fat milk and gelatin) can mask Western blot protein signals.



The distinct bands (p-ERK1: 44 kDa, p-ERK2: 42 kDa) were successfully detected with minimal background staining.

Description	Cat. No.	Quantity
PVDF Blocking Reagent for Can Get Signal	TYB-NYPBR01	500 mℓ

Can Get series - Immuno reaction Enhancers

Intended Use

Immunoreaction enhancing reagent sets for Immunoassays and Immunostaining procedures.

Features and Advantages

1: Enhancing signals in immunostaining

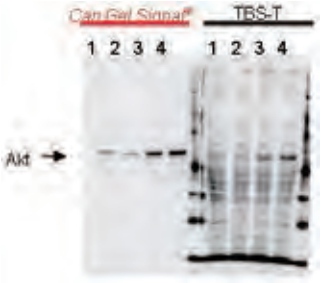
This solution has an effect on enhancing an antigen-antibody reaction, and allows to get clearer signals than the conventional methods.
It can reduce the amount of secondary antibody used and exposure time in fluorescence/luminescence detection system, accordingly images with high S/N ratio and low background can be obtained.

2: Compatible with a wide range of antigens and antibodies

Two different solutions with different reaction-enhancing effects (Solution A and Solution B) are prepared. Users can select the more suitable one for their target according to the experimental system.

3: Wide versatility

It is applicable to all detection systems involving chemical coloration, chemiluminescence and fluorescence because of its composition having no effect on labeling enzymes and fluorescent dyes.
It can be used in combination with sensitizing systems such as ABC or polymer-complex method.



Detection of phosphorylated Aktt with anti-phpspho-Akt antibody

Sample: Cultured bovine adrenomedullary cells
1. Control (H2O)
2. Insulin (1 nM, stimulated for 5min.)
3. Insulin (10 nM, stimulated for 5min.)
4. Insulin (100 nM, stimulated for 5min.)

Peroxidase Stabilizer ST2010

Intended Use

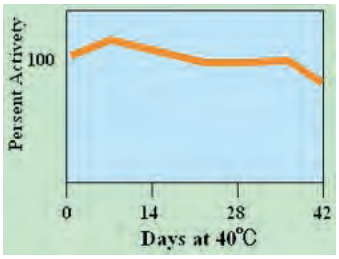
Synthetic polymer type peroxidase enzyme stabilizer

Background

This reagent for is mede of synthetic polymers and does not contain no materials derived from animals, thus has no danger of infection (such as Creutzfeldt-Jacob disease) from animals. Since synthetic polymers are the main components, all lots are quite uniform, and they can be boiled and autoclaved to sterilize and deactivate DNase. This reagents for assey are also highly stable against freezing, agitation, etc

Features

1. Peroxidase stabilizer for enzyme Immunoassay
2. Do not contain any bio-derived materials
3. Excellent stability for POD conjugate protein



POD Stability
<Remaining activity of POD that was stored at 40 Y> POD was diluted to optimum concentration (0.1㎎/㎖ in this example) with the direct POD stabilizer solution. POD solution was filtrated with 0.22㎛ pore-size filter, and store at 40℃. POD activity was measures with H2O2-ABTS coloring-system. The activity at initial time (0 days) was indicated as 100 %.

Description	Cat. No.	Quantity

ALP Stabilizer ST4010	NOF-51005016	100 ㎖

Blocking Reagent series

Intended Use

Blocking Reagent for Immunoassay development

Background

This reagents for assay consist mainly of synthetic polymers and contain no materials derived from animals, so there is no danger of infection (such as Creutzfeldt-Jacob disease) from animals. Since synthetic polymers are the main components, all lots are quite uniform, and they can be boiled and autoclaved to sterilize and deactivate DNase. This reagents for assey are also highly stable against freezing, agitation, etc.

Features

1. There are two products, NB2025 and NB3025 synthetic polymers, which are different in molecular structure.
2. Highly effective for restraining nonspecific absorption
3. Highly effective for stabilizing physiologically active substances that have been immobilized on carriers
4. NB2025 is excellent for stabilization whereas NB3025 is optimum for restraining nonspecific absorption. However, evaluation before each experiment is recommended.
5. Liquid form enabling immediate use after dilution
6. Suitable as sample dilution and cleaning solution
7. Highly stable to Tween 20.

Description	Cat. No.	Quantity
Blocking Reagent NB2025	NOF-51005011	250 ㎖
Blocking Reagent NB3025	NOF-51005012	250 ㎖

Easy WESTERN II Quick

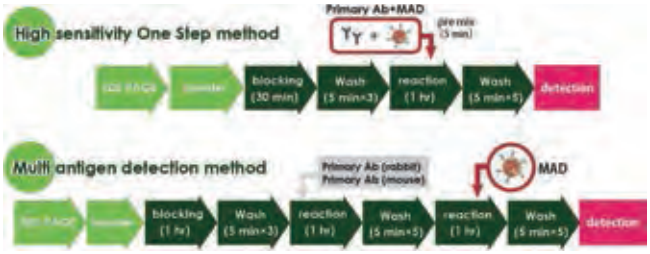
Intended Use

For Fast Antigen Detection or Multi-Antigen Detection

Background

Easy-WESTERN (EZW) is a primary antibody detection reagent kit for Western blots. The kit is based on the Multi-Antibody Detection (MAD) technology. The MAD reagent is nano-size protein particles with high affinity to antibodies. Each particle is composed of about 100 antibody-binding proteins and is labeled with 50 HRP molecules. Because of these properties, MAD reagent enables high sensitivity and quick detection of primary antibodies.

The Easy-WESTERN kit is ideal for high sensitivity, signal enhancement, and simultaneous detection of multi-antigens that is not possible with standard Western blot techniques.



Feature & Advantages

- No need for secondary antibody - MAD reagent can detect most primary antibodies*
- Higher signal for weakly expressed antigens
- Enhance signal by easy reprobing - no stripping the membrane
- Improve signal while using less primary antibodies

* MAD reagent may not work well with goat IgG. For best results use Mouse IgG Enhancer with mouse IgG1 primary antibodies. The performance of EZW depends on the type of antibody, and we do not warrant higher sensitivity in all cases.

Description	Composition	Cat. No.	Quantity

DNA Quantity Kit

Intended Use

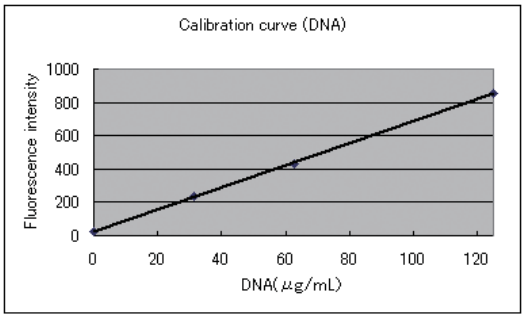
Quantitative determination of DNA concentration

Background

The DNA Quantity Kit (Cat.No.PMC-AK06-COS) is designed to quantify DNA directly from cell culture. DNA can be quan tified without purification process from cell culture as Color De velopment Reage nt binds to cellular double stranded DNA and emits blue fluorescence at 458 nm.

Preparation of Standard Curve

1. Standard sample preparation
   - Dilute the stock DNA Standard (100 μg/mℓ) to 50, 25, 12.5 and 0 μg/mℓ with purified water.
   - Diluted sample standards can be stored frozen at -20℃.
2. Transfer each 50 μℓ of standard sample to new tubes.
3. Add 1mℓ Dilution Buffer to each standard sample and mix well.
4. Add 50 μℓ of Color Development Regent to each tube.
5. Mix thoroughly.
6. Measure fluorescence. (Excitation wavelength at 356nm, emission wavelength at 458nm)



Sample Analysis (24well plate format)

1. Remove culture medium and rinse the culture plate with Phosphate Buffered Saline (PBS).
2. Remove PBS and add 500 μℓ of dilution buffer to each well.
3. Sonicate cells until completely homogenated.
4. Transfer 50 μℓ of homogenate sample to new tube.
5. Add 1mℓ of Dilution Buffer to each tube and mix well.
6. Add 50 μℓ of Color Developer to each tube.
7. Mix thoroughly.
8. Measure fluorescence. (Excitation wavelength at 356nm, emission wavelength at 458nm)

Composition

- Color Development Reagent (10 mℓ)×1 bottle
- Dilution Buffer (150 mℓ)×2 bottles
- DNA standard (2 mℓ : 100 g/mℓ)×1 tube

Picotan/Picotein protein detection kit

Intended Use

A high sensitivity protein detection tool. Proteins can be detected in pg level.

Reaction Condition

Mix this product and protein solution (1 : 1) and incubate 1 hr at 37℃ (or incubate 16 hr at room temperature) to label DNP to protein. Molecular marker proteins are needed to react in the same condition with the samples.
React DNP-protein, Picotan/Picotein Anti DNP-IgG (Cat. No. LSL-LP-2001) and second antibody (labeled). 10-100 pg of proteins are detected.
Primary antibody (HRP-labeled) (Picotan/Picotein Anti DNP-IgG (Cat. No. LSL-LP-6011) can also be used.

Description	Cat. No.	Quantity
Activated DNP	LSL-LP-0101	1 mℓ
Picotan/Picotein Anti DNP-IgG	LSL-LP-2001 LSL-LP-6011	1 mg 0.1 mg

Alkaline Phosphatase Staining Kit

Intended Use

Detection of Osteoblasts

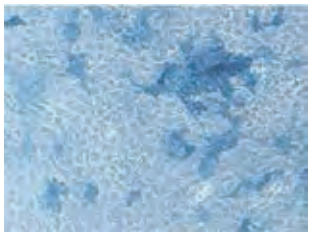
Background

The Alkaline Phosphatase Staining Kit is suitable for the staining of alkaline phosphatase in osteoblasts. Bone mass is controlled by the balance between the activity of osteoblasts bone formation and the activityof osteoclasts. Alkaline phosphatase and tartrate-resistant acid phosphate (TRAP: TRAP staining kit , Cat. No. PMC-AK04F-COS) are used as markers for osteoblasts and osteoclasts, respectively.

Protocol

(12-well plate format)

1. Remove culture medium. Wash each well three times with 1mℓ of PBS.
2. Add 500μℓ of the 10% Formalin Neutral Buffer Solution to each well and fix for 20 minutes at room temperature.
3. Remove 10% Formalin Neutral Buffer Solution. Wash each well with 2mℓ of deionized water. (× 3 times)
4. Dissolve 1 vial of Chromogenic Substrate with 5mℓ of Substrate-containing Buffer.
5. Add 400μℓ of Chromogenic Substrates to each well.
6. Incubate at 37 for 5-20 minutes. Adjust incubation time until stained ALP is clearly showing the result in figure 1.
7. Wash with deionized water to stop the reaction.
   Note: Excess incubation will be the cause of overstaining.



ALP staining of 3T3-E1

Composition

- Substrate-containing Buffer (50 mℓ)×1 bottle
- Chromogenic Substrate×10 vials
- One kit contains regents for 10 × 12-well plates

<Additional Materials Required>

- 10% Formalin Neutral Buffer Solution
- Phosphate Buffered Saline (PBS)
- Distilled or deionized water

Pancreatic β-cell Staining Kit

Intended Use

Pancreatic β-cell Fluorescent Staining Kit (PMC-AK11F-COS) is designed to stain insulin-producing β-cells, using an anti-insulin antibody. This product is available for mouse and rat β-cells.

Protocol

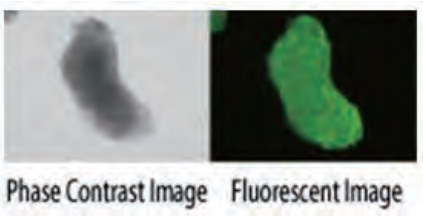
1. Transfer pancreatic cells (1.0×10^5 cells and above) or 10-20 pancreatic islets into a suitable centrifuge tube such as 1.5 mℓ centrifuge tube.
2. Centrifuge at 2,000× g for 3 minutes and remove the supernatant.
3. Fix cellswith 0.5 mℓ of fixative solution at 4℃ over night.
4. Centrifuge at 10,000× g for 3 minutes and remove the fixative solution.
5. Add 1 mℓ of Washing Buffer to centrifuge tube and centrifuge at 10,000× g for 3 minutes, and then remove the WashingBuffer. (× 3 times)
6. After removing the Washing Buffer, add 100 μℓ of Blocking Buffer to the centrifuge tube and leave for 30 minutes at room temperature.
7. Centrifuge at 10,000× g for 3 minutes and remove the Blocking Buffer.
8. Add100μℓ of Blocking Buffer to the centrifuge tube and add 2 μℓ of Anti-insulin antibody to the tube. Mix gently using a micropipette and leave the tube at room temperature for one hour.
9. Centrifuge at 10,000× g for 3 minutes and remove the Anti-insulin antibody.
10. Add 1 mℓ of Washing Buffer to the centrifuge tube and centrifuge at 10,000× g for 3 minutes. Remove the Washing Buffer (× 3 times).
11. After removing the Washing Buffer, add 100 μℓ of Blocking Buffer to centrifuge tube and add 2 μℓ of Fluorescein Secondary Antibodies to the tube. Mix gently using a micropipette and leave the tube at room temperature for one hour.
12. Centrifuge at 10,000× g for 3 minutes and remove the Anti-insulin antibody.
13. Add 1 mℓ of Washing Buffer to the centrifuge tube and centrifuge at 10,000× g for 3 minutes, and remove the Washing Buffer. (× 3 times)
14. Examine cells with an excitation filter of 459 nm and an emission filter of 520 nm .

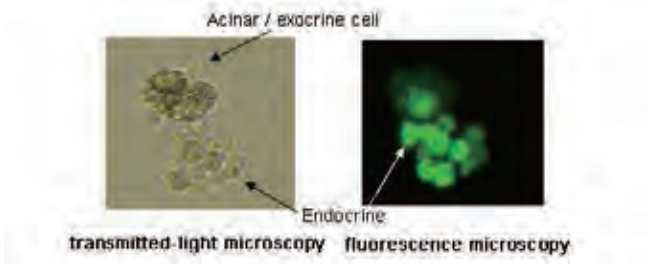
Composition

- Washing Buffer (100 mℓ)×1 bottle
- Blocking Buffer (2 mℓ)×1 bottle
- Anti-insulin Antibody (20 μℓ)×1 vial
- Fluorescein Secondary Antibodies (20 μℓ)×1 vial
- One kit contains regents for 10 samples
- Species Cross-Reactivity: rat, mouse

Additional Materials Required

- fixative solution 4% Paraformaldehyde Phosphate Buffer Solution





Description	Cat. No.	Quantity
Pancreatic β-cell Staining Kit	PMC-AK11F-COS	1 set

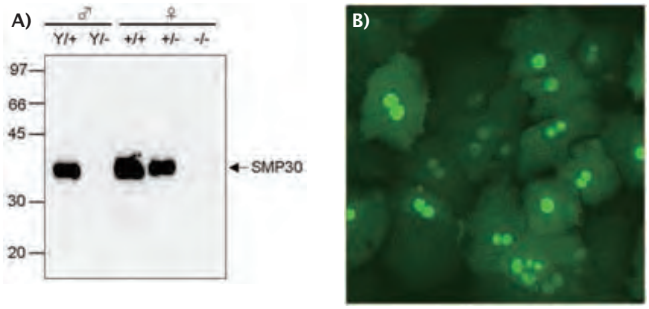
SMP30 [Gluconolactonase, GNL] WesternBlot & ImmunoStain Kit

Intended Use

Aging, Vitamin C and Lung Disease Research Kit

Background

SMP30 (Senescence Marker Protein-30) is a 34-kDa protein whose tissue levels in the liver, kidney, and lung decrease with aging (1, 2). SMP30 expressed in multiple tissues including the liver, kidney, brain, lung, adrenal gland, stomach, ovary, uterus, testis and epidermis. Recently, SMP30 was identified as the lactone-hydrolyzing enzyme gluconolactonases (GNL) of animal species (3). GNL is a key enzyme which involve in vitamin C (L-ascorbic acid) biosynthesis. SMP30 knockout micedisplayed symptoms of scurvy when fed a vitamin C-deficient diet. Moreover, SMP30 protects mice lungs from oxidative stress associated with aging and smoking (4). Thus SMP30 is a key age-associated protein for aging, vitamin C and lung disease research.



A) Western Blot Analysis
Antibody: Rabbit anti SMP30/GNL antibody 0.1㎖
Specimen: SMP30/GNL Knockout Mouse Liver 2 slides, Wild type Mouse Liver 2 slides

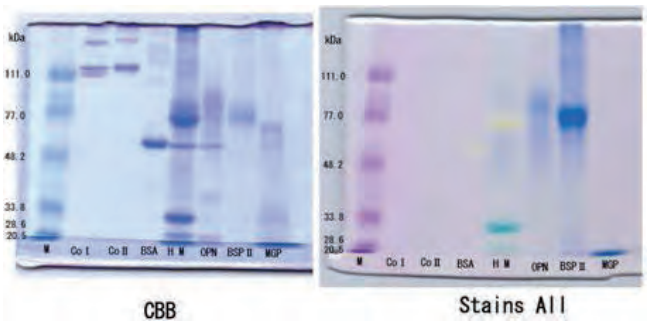
Stains All Gel Staining Kit

Intended Use

The Stains All Gel Staining Kit (Cat.No.AK02) is specifically designed to stain strongly acidic proteins.The color of the protein band varies depending on the Protein's isoelectric point and chemical modifications like glycosylation and phosphorylation.

Background

Acidic Proteins that reg ulate bone calcification such as O steocalcin, Osteopontin and BS P Ⅱ, are maj or components of bones and teeth.These acidic proteins are difficult to detect by conventional staining methods of SDS-PAGE gels.



Composition

- Staining Stock Solution (×10) 40 ㎖
- Dilution Buffer 200㎖ × 2 bottles

Stains All Gel Staining Kit	PMC-AK02-COS	1 kit

Calcified Nodule Staining kit

Intended Use

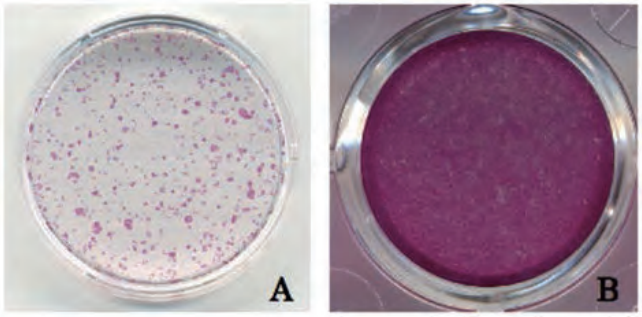
Calcified Nodule detection

Background

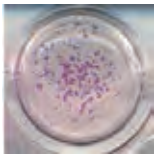
Alkaline phosphatase, osteopontin, and osteocalcin are expressed during the differentiation of bone marrow cells into mature osteoblasts and osteoblasts form calcium tubercle. Alizarin Red S, an anthraquinone derivative, has been usedtoidentify Calcified nodule, because Calcium forms an Alizarin Red S-calcium complex, and the products turn (became) red. Calcified Nodule Staining kit contains Substrate-containing Buffer composed mainly of Alizarin Red S and Chromogenic Substrate,and provides a convenient system for staining calcified nodule with ease.

Composition

Substrate-containing Buffer (×100) (60 mℓ)×1 bottle
Chromogenic Substrate×10 vials
*One kit contains regents for 24-well plates×10



A: 3T3-E1 cells are cultured using Osteogenesis Culture for Osteogenesis Culture kit (Mouse) (Code No. PMC- OGCMO-COS) (35 mm dish)
B: Cells in Osteogenesis Culture Kit (Mouse) (PMC-OGC11-COS) (24well plate)



Description	Cat. No.	Quantity
Calcified nodule Staining kit	PMC-AK21-COS	1 set

TRAP Staining Kit

Intended Use

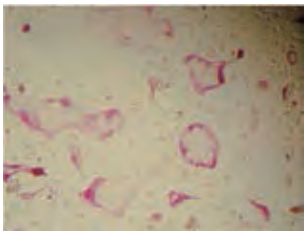
Detection of Osteoclast

Background

The TRAP Staining Kit is used for the staining of Tartrate-Resistant Acid Phosphatase in osteoclasts. Bone mass is controlled by the balance between the activity of osteoblasts bone formation and osteoclasts.
Alkaline phosphatase (ALP staining kit, Cat.No.PMC-AK20-COS) and tartrate-resistant acid phosphate are used as markers for osteoblasts and osteoclasts, respectively.

Protocol (96-well plate format)

1. Remove culture medium. Wash each well once with 100 μℓ of PBS.
2. Add 50 μℓ of the 10% Formalin Neutral Buffer Solution to each well and fix for 5 minutes at room temperature.
3. Wash each well with 250 μℓ of deionized water. (× 3 times)
4. Dissolve 1 vial of Chromogenic Substrate with 5 mℓ of Tartrate-containing Buffer.
5. Add 50 μℓ of Chromogenic Substrates to each well.
6. Incubate at 37℃ for 20-60 minutes. Adjust incubation time until stained TRAP is clearly showing.
7. Wash with deionized water to stop the reaction.
   Note: Excess incubation will be cause of over staining.



TRAP staining of Osteoclast

Composition

Tartrate-containing Buffer (50 mℓ)×1 bottle
Chromogenic Substrate×10 vials

D-Serine Colorimetric Assay Kit

Intended Use

Measurement Kit for D-Serine in urine and food samples

Background

D-form amino acids have long been known as components of bacterial cell wall peptidoglycan layers. More recent developments in analytical technologies have demonstrated that D-amino acids are also present in mammals and display specific and important physiological activities. Particularly high levels of D-serine levels are present in brain tissue where D-serine functions as an important co-agonist of N-methyl-D-aspartate (NMDA) receptors (NMDR), involved in regulating higher brainfunction such as memory and learning. D-serine is suggested to play a role in neurodegeneration associated with diseases such as Alzheimer's disease (AD) and amyotrophic lateral sclerosis (ALS). High levels of free D-serine can also be found in human urine although its significance is unclear.
D-serine is commonly assayed by HPLC or GC following conversion of D-serine to diastereomer derivatives. Such methods are time consuming, require expensive instrumentation, and are not suitable for processing large numbers of samples. The D-Serine Colorimetric Assay Kit employs the D-form specific enzyme D-serine dehydratase from Saccharomyces cerevisiae (DsdSC) enabling the quantitation of D-serine by spectrophotometric measurement.

Advantages

1. Enzymatic reaction with colorimetric detection for reading on standard UV/VIS absorbance microplate readers (340 nm).
2. Suitable for large numbers of samples.
3. Quantitative for D-serine detection. Detection range: 0.01 mM - 1 mM

Principleof Assay

DsdSC catalyzes the conversion of D-serine to pyruvate and ammonia. In the presence of lactate dehydrogenase (LDH), pyruvate is reduced to lactate with the concomitant oxidation of NADH to NAD. The reaction can be monitored by measuring the decrease in absorbance at 340nm due to the oxidation of NADH. The D-serine concentration in unknown samples is determined by comparison with a standard curve.

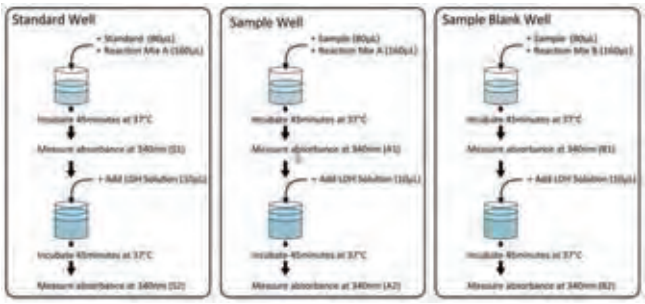

Figure 2 : Overview of the assay procedure

Sample

Urine

Composition

- Assay Buffer (11 mℓ)×2 vials
- LDH Diluent Buffer (3 mℓ)×2 vials
- 10mM D-Serine Solution (2 mℓ)×2 vials
- NADH Solution (200 μℓ)×2 vials
- DsdSC Solution (110 μℓ)×1 vial
- LDH Stock Solution (220 μℓ)×1 vial
- 96-well plate×1 plate

ACE test (autoclave, EO Gas, H2O2, LTSF, formalin, steam sterilization 115 degree)

Background

ACE test are biological indicators with chemical indicators which can confirm whether the sterilization has been carried out properly for autoclave, EO Gas, H202, LTSF, formalin, and steam sterilization at 115℃.

Features

- Easy culturing that do not require sterile operations.
- Highly reliable sterilization results can be easily obtained with 24 hours, 48 hour or 7 day culturing.
- Sterilization results can be easily checked with the chemical indicator on the label.
- Can be used with US incubators (Ace Test size: Length 46.5 ㎜×diameter 8.5 ㎜)
- Matches criteria required as a biological indicator for JP, USP, EN866, and ISO11138 Sterilization methods.

NOTE: ACE mini INCUBATOR is available for usage together (pg176).

ACE test (Dry Heat Kit)

Background

The ACE test (Dry Heat Kit) contains a biological indicator (H6302) and culture medium for *Bacillus atrophaeus* (H6302M).
When cultured with the conventional soy bean digest medium, 5-7 days are required. However, with H6302M medium, it only takes 48 hours of culturing for highly reliable sterilization.

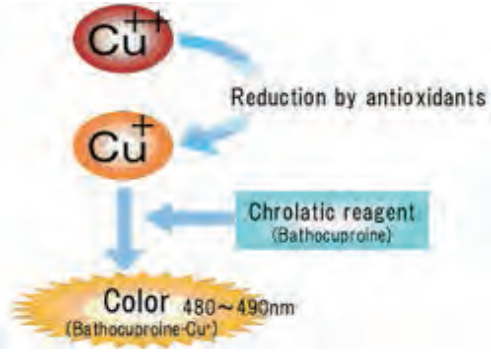
Potential Anti Oxidant (PAO) kit

Intended Use

Test kit for Total Antioxidant Capacity

Background

Oxidative stress plays an important role in various diseases and aging. The control of oxidative stress is expected to be useful to prevent diseases and aging. Oxidative stress is caused by the imbalance between reactive oxygen species (ROS) and antioxidant defense system. For accurate assessment of oxidative stress, measurement of ROS, oxidative damage and antioxidant activity may be essential. PAO can detect not only hydrophilic antioxidants such as Vitamin C, glutathione, but also can detect hydrophobic antioxidants such as Vitamin E. Applicable for assessment of total antioxidants of serum, foods and beverage samples.



Composition

- Standard (Uric acid powder), 1 vial (for 2 mM)
- Sample diluent, 60 mℓ×1 bottle
- Cu^{++} solution, 5 mℓ×1 bottle
- Stop solution, 5 mℓ×1 bottle
- Micro titer plate, 1 plate

Protein Carbonyls Immunohistochemical Staining Kit (50 slides)

Intended Use

For the specific detection of protein oxidation by ROS.

Background

Reactive oxygen species (ROS) are produced as a result of normal cell metabolism or by exposure to ionizing radiation, chemicals, or other environmental stress. ROS are well known to promote non-specific protein oxidation, with negative effects protein structure and function. Typical ROS-induced protein modifications include the transformation of lysine, arginine, proline, and threonine side chain amines into aminoacyl carbonyls. The chemical stability of these carbonyl derivatives allows their detection and quantification, providing a sensitive and reliable marker of ROS-mediated protein oxidation. In the central feature of this kit, carbonyl groups in tissue are first derivitized by reaction with 2,4-Dinitrophenylhydrazine (DNPH). DNPH-derivitized carbonyls are then detected using an anti-DNP specific antibody suitable for immunohistochemical procedures. The Protein Carbonyls Immunohistochemical Staining Kit is the first kit to enable detection of protein carbonyls by immunohistochemical staining. A detection kit for protein carbonyls in cell lysates by Western blotting with anti-DNP antibody is also available (Cat No.SML-ROIK03-EX).

Immunohistochemical staining
Mouse liver and kidney sections stained with rabbit anti-DNP antibody at 1:100 dilution and developed by 3,3' -diaminobenzidine (DAB). Specimens were incubated with (DNPH(+)) or without (DNPH(-)) DNPH solution. Protein carbonyls are detected only in DNPH-treated specimen and not detected at all in untreated specimen.

Vitamin C Assay kit

Intended Use

This Vitamin C Assay Kit measures total vitamin C (AsA + DHAsA).

Vitamin C (L-Ascorbic acid) is water-soluble vitamin with strong reducing action and is an important coenzyme for internal hydroxylation reactions (e.g. collagen). Vitamin C is found in both reduced form (ascorbic acid (AsA)) and oxidized form (dehydroascorbic acid (DHAsA)). This Vitamin C Assay Kit measures total vitamin C (AsA + DHAsA). The method of this kit is a refinement of the colorimetric assay described by Daniel (1973).

Composition

- Reagent (1):Oxidizing agent, 1 vial (2 mℓ)
- Reagent (2): 5% Metaphosphoric acid/2% $SnCl_2$, 1 vial (10 mℓ)
- Reagent (3): 2,4-Dinitrophenylhydrazine (DNPH), 1 vial (Dissolve in 3 mℓ 44% sulfuric acid)
- Reagent (4): 5% Metaphosphoric acid,

L-Glutamate Assay Kit II

Intended Use

Determination of L-glutamate using L-glutamate oxidase inbiological samples.

Preparation of color Reagent Solution

Reconstitute the Enzyme reagent in the vial with approximately 1㎖ Buffer. Transfer all of the enzyme reagent into the bottle of buffer.

Standard Procedure for the Assay

Standard Procedure for the Assay
Samples should be determined in duplicate.
1. Add 900㎕ of Color Regent Solution to all tubes.
2. Add 60㎕ of sample to tubes for sample. (A)
3. Add 60㎕ of Standard Solution to tubes for standard. (S)
4. Add 60㎕ of distilled water to tubes for blank 1. (R)
5. Add 900㎕ of distilled water to tubes for blank 2. (B)
6. Mix each tubes.
7. Stand each tubes for 20 �min at room temperature.
8. Measure absorbance at 660 ㎚.
9. Calculate the concentration of L-glutamate as follows; L glutamate (㎎/ℓ)=(A-B-R)/(S-R)×100×(dilution ratio)

Composition

- Buffer: Good's buffer (pH 7.1) 1 bottle (60 ㎖)
- Enzyme Reagent: Enzyme (lyophilized powder) 1 vial
- Standard Solution: L-glutamate solution (100 ㎎/ℓ) 1 vial (1.5 ㎖)

Type I collagenase assay kit

Intended Use

For measurement collagenase activity

Back ground

Type I collagenase has an important role on the collagen metabolism and cleaves Type I collagen, which one of the collagen family comprising 9 members, yielding 1/4 and 3/4 collagen fragments. Type I collagenase Assay Kit (PMC-AK37-COS) is designed to quantify Type I collagenase activity using a fluorescent-labeled collagen as a substrate. This kit provides a convenient system for studying, for example, arthitic synovial in which Type I collagenase activity can be detected.

Composition

- Fluorescence-labeled collagen 6 ㎖×2 bottles
- Buffer A 100 ㎖×1 bottle
- Buffer B 150 ㎖×1 bottle

Description	Cat. No.	Quantity
Type I collagenase assay kit	PMC-AK37-COS	1 kit

Luciferase FM

Background

The determination of ATP concentration in unknown samples by bioluminescence using ATP-dependent luciferase enzymes is a well-established method. Luciferase FM is a genetically modified variant of native North American firefly (photinus pyralis) luciferase generating a luminescence intensity approximately 10 times greater than wild-type enzyme.
The increased brightness of Luciferase FM significantly extends the limits of ATP detection in standard assays. Take advantage of Luciferase FM's superior properties to extend the limits of ATP detection in your lab.

Luciferase FM PLUS

Background

Luciferase FM is a genetically modified variant of native North American firefly (photinus pyralis) luciferase generating a luminescence intensity approximately 10 times greater than the wild type enzyme (see reverse) and thus, ideally suited for high sensitivity ATP detection. The Luciferase FM Plus Reagent Set includes ATP-free water and an optimally formulated lyophilized premix containing Luciferase FM enzyme, luciferin, and buffer salts to deliver the ultimate sensitivity in ATP detection.

Principle of Luciferase FM Detection

Kit conponents : 2 x 5 mℓ Luciferin FM reagent premix, lyophilized. 30 mℓ AT-free sterile water, Ready to use.

Cells / Tissue Culture

Porcine Fertilization Medium and Culture Kit

Intended Use

Basic Culture Kit for Porcine Embryos *in vitro*

Background

This kit is for culturing porcine embryos *in vitro*. It consists of porcine oocyte/embryo collection medium (POE-CM), basic medium for porcine oocyte maturation (POM), porcine fertilization medium (PFM), defined medium for porcine embryos (PZM-5), dbcAMP concentrated solution-100X (dbcAMP-100X) and Reproplate.
This kit can efficiently produce transferable embryos (blastocysts) under a low oxygen condition (5% O_2/5% CO_2/90% N_2, 39℃) without coculture of cumulus/granulose cells.

Composition

1) Porcine oocyte/embryo collection medium (POE-CM)
   Catalog No.: CSR-CK020, 100 mℓ×5 units
2) Basic medium for porcine oocyte maturation (POM)
   Catalog No.: CSR-CK021, 25 mℓ×3 units
3) Porcine fertilization medium (PFM)
   Catalog No.: CSR-CK023, 100 mℓ×2 units
4) Defined medium for porcine embryos (PZM-5)
   Catalog No.: CSR-CK024, 25 mℓ×3 units
5) dbcAMP concentrated solution-100X (dbcAMP-100X)
   Catalog No.: CSR-CK027, 0.5 mℓ
6) Reproplate
   Catalog No.: CSR-CK028, 10 plates×10 units

Cosmedium Virus Production Serum-free Media

Intended Use

Serum-free media for virus production.

Background

MDCK Cell Serum-free Media

The media does not contain unnecessary proteins such as FBS, thus purification of virus and recombinant proteins can be carried out with ease with MDCK cells.

Vero Cell Serum-free Media

The serum-free media contains very little proteins and is ideal for culturing cells such as MDCK and BHK-21. The media does not contain unnecessary proteins such as FBS, thus purification of virus and recombinant proteins can be carried out with ease with Vero cells.

CHO Cell Serum-free Media

The media is ideal for growing and maintaining suspension CHO cells, and high yield production of recombinant proteins. The media does not contain unnecessary proteins such as FBS, thus purification of virus and recombinant proteins can be carried out with ease with CHO cells.

Other Media

Intended Use

For Culturing Hybridomas

Features

- Stable culturing at high density is possible. By making use of a high density culturing incubator, it is possible to collect more than 1㎎/㎖ of antibody.
- Media is ideal for hybridomas which produce more antibodies towards the end of culturing.
- Media enables stable maintenance of high density cells such as hybridomas of more than 200 × 10^6 cells/㎖ According to culture conditions, cell density of more than 10^8 cells/㎖ is possible.
- Storage for 8 months is possible under dark conditions at 4～8℃.
- Media contains an effective buffer which doesn't allow the pH to change excessively.
- Media is serum-free and does not contain Alubumin. Protein content is less than 5 ㎎/ℓ of transferin and insulin.

Application

The media is suitable for culturing of antibody-producing cells and isolation of antibodies. The media is suitable for culturing of mouse and human hybridoma cells.

Culturing of Cell lines

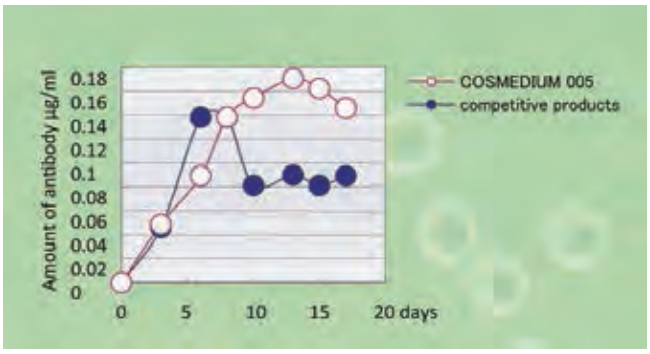
The media is suitable for production processes such as culturing of high density drug-producing cell lines.

Cloning

Cloning of mouse hybridoma cells by the limiting dilution method can be carried out efficiently.

Composition

L-Glutamine, includes antibiotics (60 ㎎/ℓ Kanamycin)



Antibody Production by Hybridoma

Mouse Reproductive Engineering-FERTIUP®, CARD MEDIUM®, and Accessories

Intended Use

To stabilise and improve spermatozoa cryopreservation results and *in vitro* fertilization rates for laboratory mice

Background

Sperm cryopreservation is a practical and cost-effective method of archiving mouse strains in a laboratory. FERTIUP® and CARD MEDIUM® are high-performance media for mouse sperm cryopreservation, sperm preincubation and *in vitro* fertilization (IVF). When used in combination, FERTIUP® and CARD MEDIUM® provide a high and stable rate of fertilization from frozen-thawed mouse sperm, which will allow you to reproduce mice as and when you need them. Notably, the FERTIUP® sperm cryoprotectant and sperm preincubation medium greatly improve the fertilization rate of frozen-thawed sperm in C57BL/6 and 129 strains, from less than 10% using conventional methods to more than 30%. In addition, our new CARD MEDIUM® enhances the fertility rate to over 80%.
Of course, it goes without saying that FERTIUP® and CARD MEDIUM® have no reproduction toxicity of any kind.
Our newly developed system for sperm cryopreservation and IVF using FERTIUP® and CARD MEDIUM® provides superior support for the safe and reliable preservation of your valuable mouse strains.

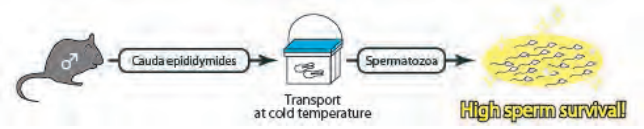
CARD Cold Transport Kit

Intended Use

Safe transport of mouse cauda epididymides and embryos at cold temperatures

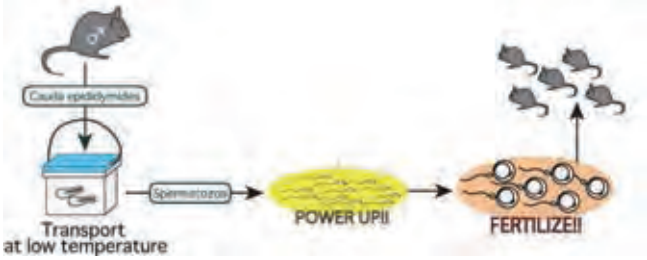
Background

The CARD Cold Transport Kit is specially-designed for cheap, safe transport of mouse cauda epididymides and embryos at cold temperatures. The CARD Cold Transport Kit allows users to reduce transport cost of live mice while also eliminating the risk of mouse fatalities or escapes during transport. Users can also prevent the transmission of pathogens using the CARD Cold Transport Kit.



Characteristics

- The CARD Cold Transport Kit uses a three-layer system (Cold packs, thermos bottle, foam transport box) to ensure that the contents remain at a constant temperature.
- The CARD Cold Transport Kit is designed so that the cold packs, thermos bottle, foam transport box and the sample can be transported while fit snugly. This prevents saccadic movement during transport, thus ensuring the safe transport of your samples.



Example usage of CARD Cold Transport Kit
It is possible to produce mouse pups easily without the presence of a male mouse by using just the cauda epididymides of a male mouse, which have been sent safely and cheaply at cold temperatures using our cold transport kit. Simply preincubate the spermatozoa taken from the cauda epididymides in FERTIUP. Mouse Sperm Preincubation Medium, then carry out *in vitro* fertilization using CARD MEDIUM, and finally transfer the embryos obtained into recipient parents.

Example Usage of CARD Cold Transport kit
It is possible to transport whole colonies of mice by using the CARD Cold Transport Kit to transport embryos at cold temperatures instead of live mice, then having the recipient institution transfer the embryos into recipient parents to obtain pups.

Composition

CARD Cold Transport Kit

- Foam transport box (1)
- Cold packs (4 large packs, 2 small packs)
- Thermos bottle (1)
- Paper box (1)
- Shock-absorbing material (1)

*Note: We recommend usage with our "Cold storage solution for cauda epididymides (Cat. No. KYD-007-EX)" which can be ordered free of charge.

Bone Resorption Assay Kit

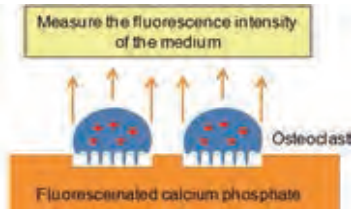
Intended Use

For skeletal metabolism research

Background

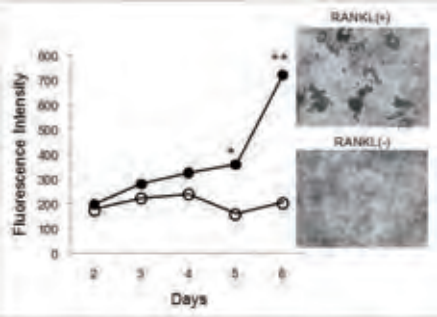
This product is an assay kit for the measurement of bone resorption activity using a fluoresceinated calcium phosphate-coated plate.

The coated calcium phosphate is first bound to fluoresceinamine-labeled chondroitinsulfate (FACS), which is released from the calcium phosphate layer into conditioned medium by osteoclastic resorption activity. Bone resorption activity is evaluated by measuring the fluorescence intensity of the conditioned medium. This assay provides a rapid evaluation system compared to the traditional pit assay.



Features

- Bone resorption activity is evaluated by measuring the fluorescence intensity of the medium.
- The fluorescence excitation and emission wavelengths are identical to those for the commonly-used fluorescent dye, FITC.
- Microscopic observation of cell morphology is possible.
- Pit area can be analysed after.
  Ready to use, sterile components.



Osteoclastic differentiation of RAW264 cells induced by RANKL (100 ng/mℓ) was evaluated by measuring the fluorescence intensity of the conditioned medium. Photographs show pit formation on the calcium phosphate (CaP) coating with or without RANKL stimulation. (●: with RANKL, ○: without RANKL, *: $p<0.05$, **: $p<0.001$)

BONE RESORPTION ASSAY KIT 24

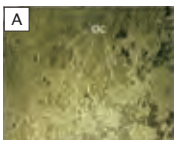
Composition

Bone Resorption Assay Kit 24

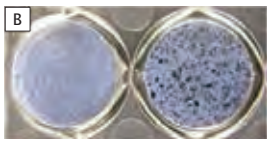
(1) Bone Resorption Assay Plate 24 (Cat. CSR-BRA-24P, sterilized): 1 plate
Calcium phosphate (CaP)-coated 24-well plate
(2) Bone Resorption Assay Facs (Cat. CSR-BRA-FACS1, PBS solution, sterilized, store below 4℃): 1 bottle
Fluoresceinamine-labeled chondroitin sulfate (FACS)
(3) Bone Resorption Assay Buffer (Cat. CSR-BRA-B1, sterilized, store below 4℃): 1 bottle
Buffer for measuring fluorescence intensity

Bone Resorption Assay Kit 48

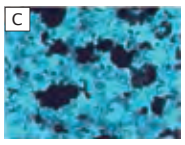
(1) Bone Resorption Assay Plate 48 (Cat. CSR-BRA-48P, sterilized): 1 plate
Calcium phosphate (CaP)-coated 48-well plate
(2) Bone Resorption Assay Facs (Cat. CSR-BRA-FACS1, PBS solution, sterilized, store below 4℃): 1 bottle
Fluoresceinamine-labeled chondroitin sulfate (FACS)
(3) Bone Resorption Assay Buffer (Cat. CSR-BRA-B1, sterilized, store below 4℃): 1 bottle
Buffer for measuring fluorescence intensity



A) Phase-contrast micrograph of RAW264 cells (day 6) cultured in CaP-coated plates stimulated with RANKL (Oriental Yeast Co., Ltd.,Tokyo, Japan; 100 ng/mℓ). Osteoclast-like cells (OC) were observed.



B) Photograph of the plate after removing cells. Pits can be observed macroscopically (Left: without RANKL; Right: with RANKL).



C) Micrograph of the pits in a CaP-coated plate (with RANKL).

Epididymal Adipocyte Culture Kit

Intended Use

For analyzing effects of drugs on metabolic syndrome such as obesity, diabetes and hypertension

Background

Epidimal Adipocyte Culture Kit H-1 contains preadipocytes isolated from mouse epididymal adipose tissues and culture medium that induces differentiation of precursor cells into mature adipocytes. The kit provides a convenient system for studying the mechanism of adipogenesis as well as for examining effectiveness of drugs on metabolic syndrome such as obesity, diabetes and hypertension.

Derived from

ICR Mouse Epididymal Adipose Tissue

Composition

- Epididymal Preadipocytes (Frozen, 1.5×10^6 cells)×1 vial
- Epididymal Adipocyte Culture Medium (Cat. No. PMC-EACMR-COS) (125 mℓ)×1 bottle

Reference

- Yoshida H. *et al.*, Biochem. Biophys. Res. Commun. 394 728-732 (2010)

Cardiomyocyte Culture Kit (Mouse)

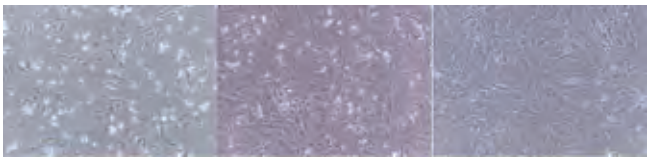
Intended Use

Useful for the research of cardiac hypertrophy, contraction and relaxation

Background

Cardiomyocytes are one of the cell groups that compose heart. Cardiomyocytes are known as beating involuntary striated muscle cells. The "beat" which are features of cardiomyocytes can be widely used for pharmacologic and electrophysiology assays, as it responds to a variety of stimuli including hormones, drugs and electricity.

The Cardiomyocyte Culture Kit contains cryopreserved cardiomyocytes, culture medium and fibronectin. Cells are isolated from mouse embryos' heart, and cardiomyocytes are enriched by removal of non-cardiomyocytes. The involuntary beat of cells can be seen in culture using the Cardiomyocyte Culture Kit (PMC-CMC12-COS)



Morphology of cardiomyocytes

Derived from

ICR Mouse Heart

Composition

- Cardiomyocytes (Frozen, 2×10^6 cells)×1 vial
- Culture Medium (Cat. No. PMC-CMCM-COS) (125 mℓ)×1 bottle
- Fibronectin (12 mℓ)×1 bottle

Protocols

< 1-1. Culturing with the 24-well plate >

A seeding density of 2.0×10^5 cells/well is recommended.

1. Thaw the Culture medium in at 37℃ water bath with gentle shaking.
2. Quickly thaw the Cardiomyocyte vial for 1 min 15 sec in a 37℃ water bath.
3. Transfer the vial contents of thawed cells into a 15 mℓ centrifuge tube containing 4.5 mℓ of Culture Medium.
4. Gently mix gently the cell suspension by slow pipetting up and down, and adjust cell density to 2.0×10^6 cells /5 mℓ solution in the tube.
5. Transfer 0.5 mℓ of cell suspension to each well offibronectin-coated 24-well plate.
6. Incubate the plate at 37℃ in a 5% CO_2 humidified incubator.
7. The next day, gently add 0.5 mℓ of fresh pre-warmed culture medium to each well.
8. Exchange the medium withfreshand pre-warmed culture medium every day or every other day until the culture reaches 80-100% of cell confluent.

* Culture reaches its confluent within 3-5 days, and cardiomyocytes begin beating.
* Do NOT use cold culture medium. Please pre-warm culture medium at 37℃ before use to ensure the viability of cardiomyocytes.

Brown Adipocyte Culture Kit

Intended Use

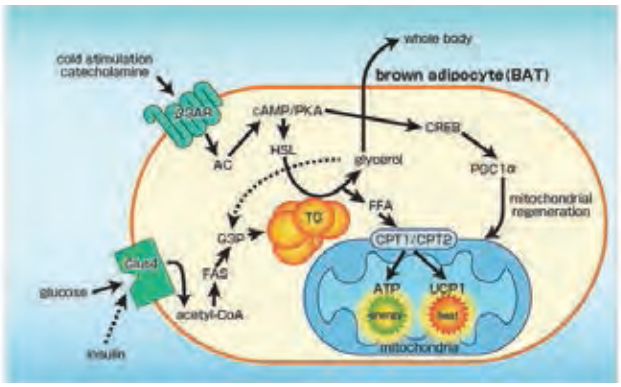
For drug development of obesity/diabetes/hypertension/ arteriosclerosis, function test of anti-obesity foods, and lipid metabolism analyses.

Derived from

SD Rat Interscapular Brown Adipose Tissue

Principle

BAT10 is preadipocyte isolated from rat brown adipose tissue. Adipose tissue plays an important role in mammalian energy equilibrium not only as a lipid-dissipating. White adipose tissue mainly has energy-storing function, but brown adipose tissue has very different function as energy-dissipating due to a unique mitochondrial uncoupling protein (UCP). Brown adipose tissue is especially abundant in newborns and in hibernating mammals. Its primary function is to generate body heat in animals or newborns that do not shiver. In contrast to white adipocyte, which contain a single lipid droplet, brown adipocyte contain numerous smaller droplets and a much higher number of mitochondria, which contain iron and make it brown. Brown fat also contains more capillaries than white fat, since it has a greater need for oxygen than most tissues.



Precautions

- Read the instructions carefully before beginning the culture.
- This kit is for research use only, not for human or diagnostic use.
- Always wear gloves and lab coat when handling the cell culture.

Composition

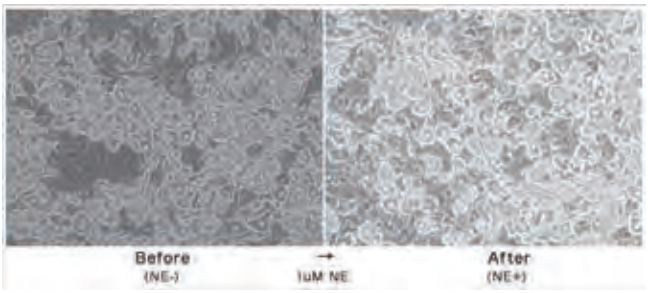
- Brown Preadipocytes (Frozen, 1×10^6 cells)×1 vial
- Brown Adipocyte Growth Medium (Cat. No. PMC-BATGM-COS) (125 mℓ)×1 bottle
- Brown Adipocyte Differentiation Medium (Cat. No. PMC-BATDM-COS) (100 mℓ)×1 bottle
- Brown Adipocyte Maintenance Medium (Cat. No. PMC-BATMM-COS) (125 mℓ)×1 bottle

Components of Media

BATGM, BATDM and BATMM are a complete media designed for optimal culture of rat brown preadipocytes *in vitro*. These are sterile, liquid basal medium (D-MEM, high glucose) which contain essential and non-essential amino acids, vitamins, other organic compounds, trace minerals, inorganic salts, growth factors, hormones, calf serum, and antibiotics. In addition, BATDM contains insulin and dexamethasone, and BATMM contains insulin. To differentiate preadipocytes to mature adipocytes, use BATDM and BATMM.

Materials required but not provided

- Variable volume pipettes
- Culture plate, 24-well, flat bottom



Comparion of UCP-1 gene expression between BAT and 3T3-L1

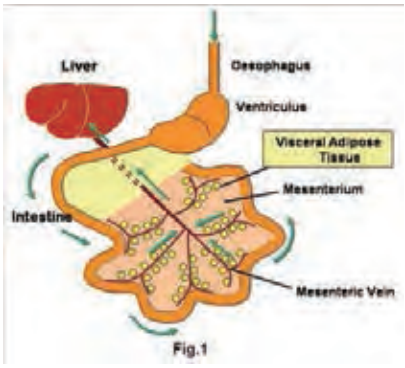
Visceral Adipocyte Culture Kit

Intended Use

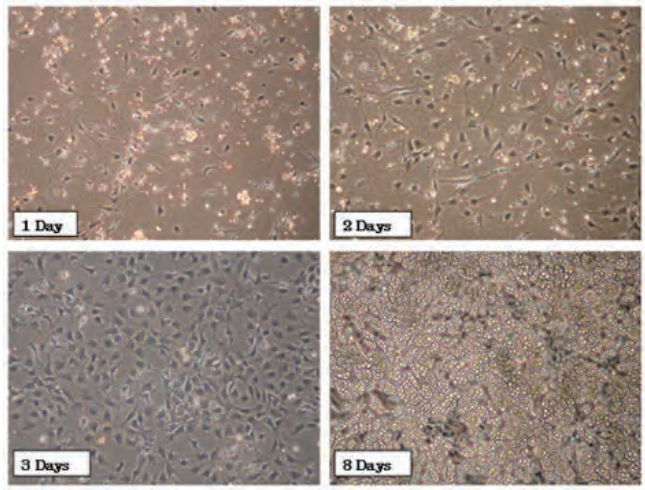
For drug development of obesity/diabetes/hypertension/ arteriosclerosis, function tests of anti-obesity foods, lipid metabolism analyses.

Background

Visceral adipose tissue, particularly mesenteric adipose tissue, is important in the pathogenesis of the metabolic syndrome. Increased delivery of free fatty acids from mesenteric adipose tissue to the liver may induce elevations in key risk factors for the metabolic syndrome, such as hyperinsulinemia and hypertriglycemia, resulting in glucose intolerance (insulin resistance). Furthermore, mesenteric adipose tissue contains adipocytes as well as macrophages, and releases a variety of bioactive factors known as adipokines, which include adipsin, angiotensinogen, leptin, MCP-1, tumor necrosis factor-α (TNF-α), and adiponectin. The kit provides a convenient system for studying the mechanism of adipogenesis as well as for screening drugs that prevent metabolic syndrome such as obesity, diabetes and hypertension by blocking the processes of adipogenesis.



Mesenteric adipocytes, a type of visceral adipocytes, are located along the portal vain that transports nutrients absorbed from the intestinal tract to the liver.



The Rat Visceral Adipocyte Culture Kit contains preadipocytes isolated from rat mesentery and culture medium that induces differentiation of precursor cells into mature adipocytes, finally causes hypertrophy.

Features & Usage

Production of adiponectin

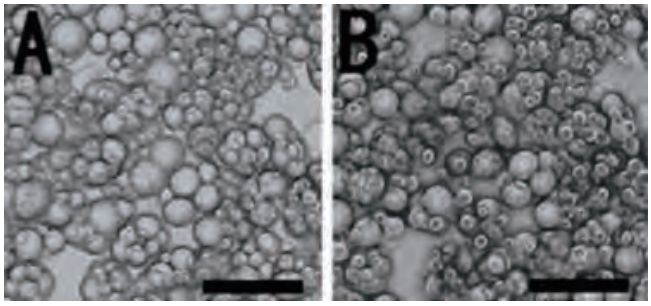
Time course of changes in adiponectin concentrations in the culture medium. The adiponectin concentration in the culture medium was measured from Day 1 to Day 7 after the beginning of cell culture. Open symbols indicate values significantly different to the value at Day 1 (control) according to Turkey's HSD test ($P < 0.05$).

Effect of norepinephrine on TG concentration adipocytes

Norepinephrine promoted lipolysis and decreased TG concentration in adipocytes. Photo-micrographs show rat matured VAs in the control before (A) and at 120 ㎷ after (B) norepinephrine application. Each horizontal bar represents 50 ㎜.

Experiment examples

- Search for obesity, diabetic, high blood pressure, and drug for arteriosclerosis
- Development of preventive food of lifestyle-related disease
- Functional test of antiobestic functional food
- Lipid metabolic experiment
- Insulin signal experiment
- Function clarification and Differentiation process of viceral Adipocyte



Effect of norepinephrine on TG concentration adipocytes: Norepinephrine promoted lipolysis and decreased TG concentration in adipocytes. Photo-micrographs show rat matured VAs in the control before (A) and at 120 ㎷ after (B) norepinephrine application. Each horizontal bar represents 50 ㎜.

Osteogenesis Culture Kit

Intended Use

To evaluate osteogenesis ability

Background

There are hematopoietic stem cells and bone marrow stromal cells in bone marrow. Bone marrow stromal cells contain undifferentiated mesenchymal stem cells that can differentiate into a variety of cell types such as osteoblasts chondrocytes adipocytes and so on. Osteogenesis Culture Kit (Mouse) (PMC-OGC11-COS) contains cryopreserved cells isolated from mouse bone marrow and two types of culture medium. The cells in this product can be grown using Growth Medium (Code No. PMC-OGCMG-COS), and then can be differentiated into mature osteoblasts, which form calcified nodules, using Culture Medium (Mouse) (Code No. PMC-OGCMO-COS).

Derived from

ICR Mouse Bone Marrow

Application example
Cells are cultured according to protocol and subjected to activity staining of alkaline phosphatase or calcified nodules. The activity of alkaline phosphatase is detected by Alkaline Phosphatase Staining kit (Code: PMC-AK20-COS) and the calcium deposit is detected by Calcified nodule Staining kit (Code: PMC-AK21-COS).

Composition

- Bone Marrow Stromal Cells (Frozen, 1×10^6 cells)×1 vial
- Growth Medium (Cat. No. PMC-OGCMG-COS) (125 mℓ)×1 bottle
- Culture Medium (Cat. No. PMC-OGCMO-COS) (250 mℓ)×1 bottle

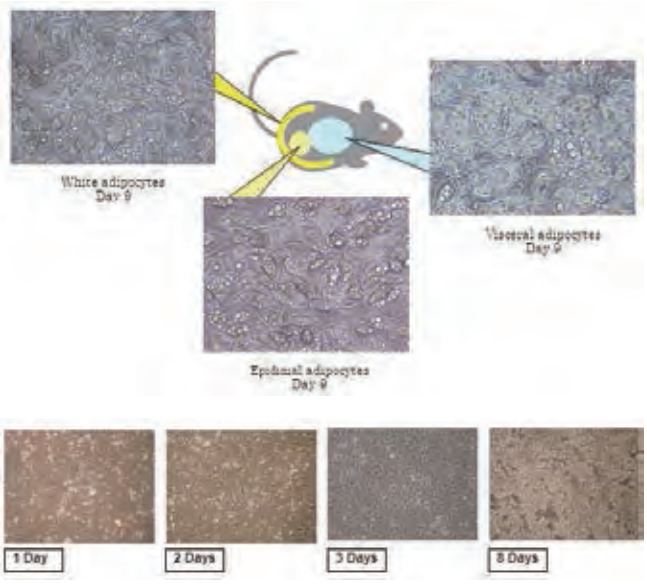
White Adipocyte Culture Kit

Intended Use

For drug development of obesity/diabetes/hypertension/arteriosclerosis, function test of anti-obesity foods, lipid metabolism analyses etc.

Background

White adipocytes play an important role in energy storage. White Adipocyte Culture Kit, V-1 (Rat) contains preadipocytes isolated from mouse subcutaneous adipose tissues and culture medium that induces differentiation of precursor cells into mature adipocytes. The kit provides a convenient system for studying the mechanism of adipogenesis as well as for analyzing effects of drugs on metabolic syndrome such as obesity, diabetes and hypertension.



Cellular Morphology

Derived From

SD Rat Waist Subcutaneous White Adipose Tissue

Feature and Advantages

- Search for obesity, diabetic, high blood pressure, and drug for arteriosclerosis
- Development of preventive food of lifestyle-related disease
- Functional test of antiobestic functional food
- Lipid metabolic experiment
- Thermal energy release experiment
- Function clarification of Brown Adipocyte
- Screening of new β3 agonist

Composition

- Subcutaneous White Preadipocytes (Frozen, 3×10^6 cells) ×1 vial
- White Adipocyte Culture Medium (250 mℓ)×1 bottle (Cat. No. PMC-SACMR-COS)

Monocyte Culture Kit

Intended Use

For culturing monocytes (rat)

Background

Monocytes are produced by the differentiation of monocyte precursor cells in the bone marrow. In tissue, monocytes mature into macrophages and are involved in immunity, recovering tissues and etc. Monocyte Culture Kit consists of cryopreserved monocyte precursor cells derived from rat bone marrow, Wash Medium and Culture Medium containing M-CSF, which induces the monocyte precursor-monocyte differentiation.

Monocyte Precusor Cell V-1	PMC-BMMC-COS	1 vial

Astrocyte Culture Kit

Intended Use

For culturing astrocytes

Derived from

SD Rat Cerebrum

Background

Astrocyte, is a type of glia cell existing in the central nervous system, which has an important role in nervous system architecture, maintenance of homeostasis of extracellular fluid and blood-brain barrier formation.

Description	Cat. No.	Quantity
Astrocyte Culture kit 【Composition】 Astrocytes (Frozen, 1×10^6 cells)×1 vial Astrocyte Culture Medium (250 mℓ)×1 bottle	PMC-AST01-COS	1 set
Astrocyte Culture medium	PMC-ASTM-COS	250 mℓ

Osteoblast From Cranial Bone Culture Kit

Intended Use

For osteogenic capability

Background

Bone metabolism is composed of balanced bone formation of osteoblasts and bone resorption of osteoclasts. Osteoblast Culture Kit (Rat) (PMC-OBC02-COS) contains frozen osteoblasts isolated from rat calvariae and culture medium. Osteoblast Culture Kit (Rat) (PMC-OBC02-COS) can be used to study osteoblast and osteogenesis.

Derived from

SD Rat Premature Cranial Bone

Composition

Osteoblasts (Frozen, 1×10^6 cells)×1 vial
Culture Medium (500 mℓ)×1 bottle (Cat. No. PMC-OBCM-COS)

Reference

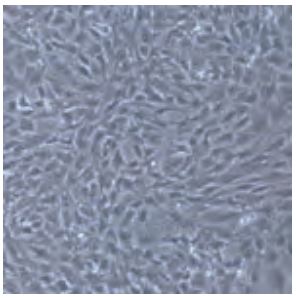
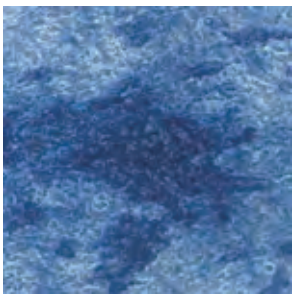
Staining with Calcified nodule Staining kit (Cat#PMC-AK21-cos) of Rat Osteoblast in confluent culture (12 well plate)



Rat Osteoblast



Staining with Alkaline Phosphatase Staining Kit (Cat#PMC-AK20-COS) of Rat Osteoblast

Protocols

Culturing with a 25 ㎠ flask

1. Thaw the culture media in a 37℃ water bath with gentle shaking.
2. Quickly place osteoblast vial in a 37℃ water bath until the contents are thawed.
3. Transfer thawed cells into a 15 mℓ centrifuge tube containing 10 mℓ of culture medium and centrifuge for 5 minutes at 4℃ at 600× g for 5 minutes.
4. Remove the supernatant, re-suspend cells in 10 mℓ of culture medium and centrifuge at 4℃ at 600× g for 5 minutes.
5. Remove the supernatant, and re-suspend the cell pellet in approximately 5 mℓ of culture medium.
6. Transfer the cell suspensionto 25 ㎠ flask and incubate the flask at 37℃ under 5% CO_2 and 100% humidity.
7. The next day, change the medium.

* Approximately 2-3 days of culture, cells become confluent. For subculture, please refer to the protocol below. Subcultureof the cells can be performed up to passage 2.

Subculturing

1. Subculture the cells when they are confluent.
2. Prepare sterile washing buffer (Hank's BSS or PBS(-)), and trypsin/EDTA solution. Warm washing buffer in a 37℃ water bath priortouse.
3. Rinse the cells with 5 mℓ of washing buffer twice.
4. Remove washing buffer and then add 3 mℓ of trypsin/EDTA solution into flask (25 ㎠ flask).
5. Gently rock the flask to make sure that the cells are covered by trypsin/EDTA solutionand thenimmediately remove trypsin/EDTA solution.
6. Incubate the flask in a 37℃ incubator until cells are completely rounded up (monitored with inverted microscope). Approximately it takes 2 to 3 minutes.
7. Add culture medium to the flask and transfer detached cells to centrifuge tube, and then centrifuge the centrifuge tube at 4℃ at 600× g for 5 minutes.
8. After removing the supernatant, re-suspend cells in culture medium and centrifuge for 5 minutes at 4℃ at 600× g for 5 minutes.
9. Remove the supernatant, and re-suspend cells in culture medium. Count cells and plate cells in a new plate or flask (Adjust cell density to the desired experiment).

* Approximately 2-3 days of culture, cells become confluent when seeding density is 30,000 cells/㎠

Mebiol® Gel 3D (PNIPAAm-PEG 3D Thermoreversible Hydrogel)

Intended Use

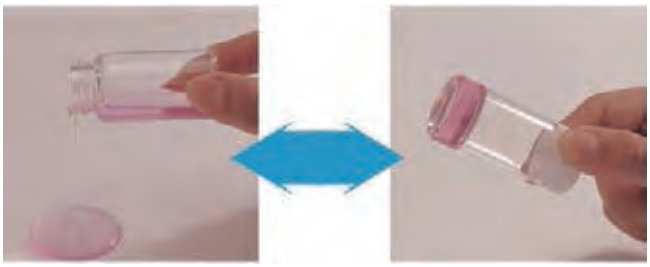
- Stem cell and pluripotent stem cell culture, expansion, and differentiation
- Spheroid culture
- Cell implantation
- Organ and Tissue Regeneration
- Drug Delivery
- Non-cell culture application

Background

The thermoreversible gelation polymer, "Mebiol® Gel" has been developed as a proprietary hydrogel. Mebiol® Gel has been commercialized as a cell and tissue culture reagent for ES cells, chondrocytes and cancer cells, etc. Mebiol Gel based intralumenal implants are being developed for occlusion of cancerous vascular system and brain aneurism.

An aqueous solution of Mebiol Gel is fluid liquid (sol state) at low temperatures (0℃, 15℃), however, it turns into an elastic hydrogel (gel state) at temperatures higher than room temperature (25℃). It is possible to mix it with various drugs or culture medium at the sol state. The sol-gel transformation of Mebiol Gel occurs fully thermoreversible. Elasticity of the hydrogel increases with temperature increase and is appropriate for three-dimensional culture of cells and tissues at around 37℃. Cells and tissues in the gel are clearly observed through optical microscope during cultivation at 37℃ owing to great transparency of the Mebiol® Gel.

Fibroblasts are alive but do not grow in Mebiol Gel, therefore other cells can be grown selectively. Cultured cells and tissues can be recovered easily from Mebiol® Gel by lowering the temperature without any damage on cells and tissues.

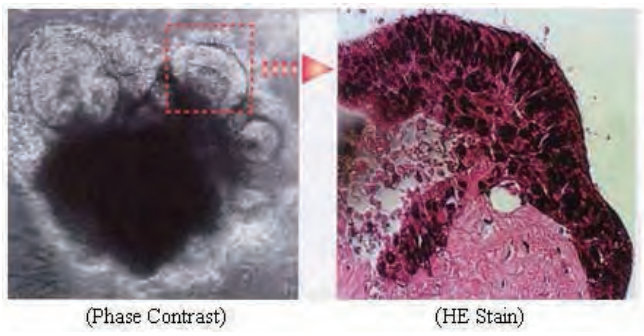


When cooled, Mebiol® Gel is a sol (handles like a liquid) but becomes a rigid hydrogel at higher temperatures

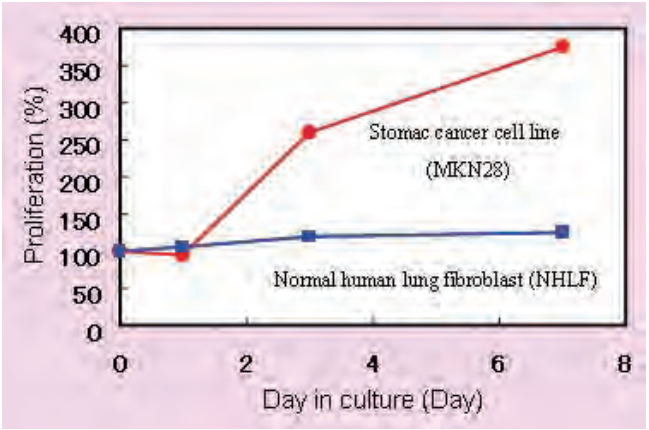
Features of Mebiol® Gel

- Easy handling
- Non-toxic, biocompatible
- 100% synthetic, pathogen free
- High transparency for cell observation Proven performance.

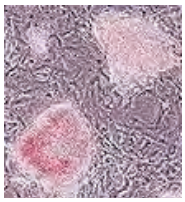
Freeze-drying Polymer is put in each flask as follows.
MBG-PMW20-1001 (10mℓ) : 1 g
MBG-PMW20-5001 (50mℓ) : 5 g



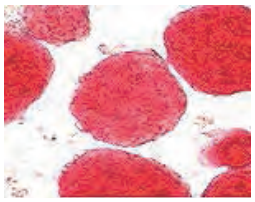
Culture of primary cancer cells in Mebiol® Gel
Selective growth of only primary cancer cells from human cancerous tissue in Mebiol® Gel (courtesy of Dr. S. Kubota, Dept. of General Surgery, St. Marianna University School of Medicine). This technology enables the characterization of patient-derived primary cancer cells and therefore enabling the evaluation of primary cells for chemosensitivity, malignancy, metastasis activity and other parameters that might influence patient therapy.



Human colon cancerous tissue was cultured in Mebiol® Gel for 10 days. Only primary cancer cells proliferate from the tissue in Mebiol® Gel. Fibroblasts growth in Mebiol® Gel is suppresed whereas In collagen and many other 3D gel culture matrices, fibroblasts overgrow and prevent proliferation of primary cancer cells.



2D on Feeder Cells
3D culture of undifferentiated mouse and Macaca ES cells cultured without LIF or feeder layer cells performed in collaboration with with Dr. K. Hishikawa, Dept. of Clinical Renal Regeneration, University of Tokyo



3D Culture in Mebiol® Gel (Day 7)
The strong positive alkaline phosphatase staining of Macaca (primate) ES cells cultured in Mebiol Gel suggests undifferentiation.

Alginate 3D Cell Culture Kit

Intended Use

3D cell culture system for a wide range of different cells types including tumor cells and chondrocytes.

Background

Transformed cells, such as tumor cells, have the characteristic feature of anchorage-independent growth, unlike normal cells. Some normal cells, such as chondrocytes, are also capable of anchorage-independent growth, and the phenotypic expression of these cells is known to be stronger compared with monolayer cultures.

Soft agar culture is a method in which cultures are grown with cells suspended in soft agar gel, and has been used conventionally as a method to detect the ability of cells to undergo anchorage-independent growth. As agar solidifies on cooling, the temperature must be maintained at approx. 37℃ while preparing the seed culture plate. Since special reagents are required when harvesting the cells in the gel, the resulting culture is not suitable for analysis of cell function.

Alginate, which is an anionic polysaccharide derived from cell walls of brown algae, form a gel in the presence of calcium and liquefy to a solution upon addition of a calcium chelating agent. Alginate gel has been a choice for three-dimensional (3D) cell culture because only cultured cells can be easily harvested.

The Alginate 3D Cell Culture Kit is a convenient, kit optimized to produce alginate gel beads.

Composition

1. Sodium alginate solution (25 mℓ ×1 bottle, sterile)
2. Calcium chloride solution (100 mℓ ×2 bottles, sterile)
3. Sodium citrate solution (100 mℓ ×1 bottle, sterile)
4. Plastic flexible needle (4 pieces, sterile)
5. 24-well plate (4 pieces, for suspension culture, sterile)

Osteoclast Culture Kit

Intended Use

To evaluate osteoclast formation and activation

Background

Bone metabolism is composed of balanced osteogenesis and bone resorption. Research studies have shown that bone marrow cells can be differentiated into osteoclasts using M-CSF (Macrophage Colony Stimulating Factor) and RANKL (Receptor Activator of NF κ B Ligand).

Derived from

ICR Mouse Bone Marrow

Composition

Osteoclast Precursor (Frozen, 2.0×10^6 cells)×1 vial
Wash Medium (Cat. No. PMC-OSCMW-COS) (50 mℓ)×1 bottle

Sodium Chondroitin Sulfate E (Squid Cartilage)

Intended Use

This product can be used as a non-labeled reference of Fluoresceinamine-labeled Sodium Chondroitin Sulfate E (E1) (Product code: CSR-FACS-E1).

Background

Chondroitin sulfate (CS) is a sulfated cosaminoglycan composed of repeating disaccharide units of N-cetyl-D-galactosamine (GalNAc) and D-glucuronic acid (GlcUA). CS is abundant in cartilage and exists as unbranched polysaccharide chains covalently linked to the protein core of proteoglycans.

This product is 10㎎ lyophilizate of sodium chondroitin sulfate E purified from squid cartilage. CSR-NaCS-E2(SqC)10 contains approximately 60% of disaccharide units with two sulfate groups as 4-O- and6-O-sulfation of GalNAc (E structure unit). This product can be used as a non-labeled reference of Fluoresceinamine-labeled Sodium Chondroitin Sulfate E (E1) (Product code: CSR-FACS-E1).

BINKIT® for NK cell expansion from PBMCs

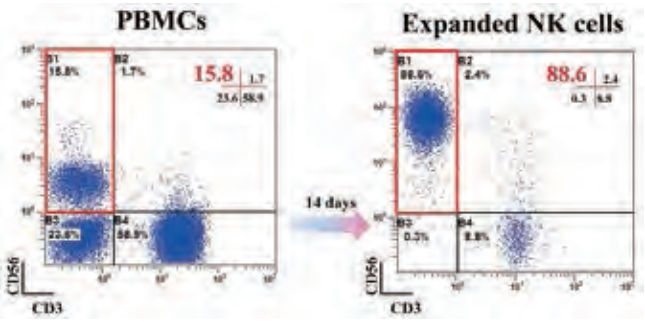
Intended Use

For culturing NK cells

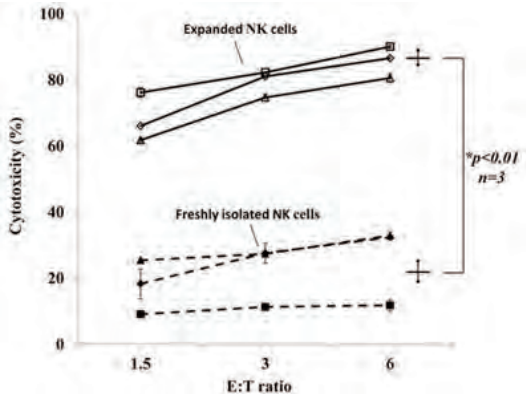
Product Features

Natural killer (NK) cells can be expanded from human peripheral blood mononuclear cells (PBMCs) without using feeder cells.

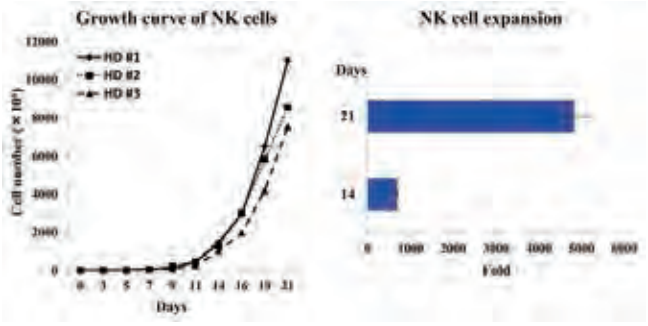
NK cells can be expanded from several hundred to several thousand-fold by 2-3 weeks of culturing.
One kit is sufficient to expand NK cells from 20-50 mℓ of whole blood.



NK cells were expanded from peripheral blood mononuclear cells (PBMCs) using BINKIT®. CD3-CD56+ cells were enriched from 15.8% to 88.6%.



NK cell cytotoxicity against K562cell line was measured for BINKIT-expanded NK cells (solid lines) and freshly isolated NK cells (dashed lines) from three independent donors. The expanded NK cells exhibited significantly enhanced cytotoxicity against K562 cell line compared with the freshly isolated NK cells ($P < 0.01$).



NK cells were expanded using BINKIT® from peripheral blood mononuclear cells (PBMCs) of healthy donors (HD; n=3). Cell count (left) and fold changes (right) indicate the efficient ex vivo expansion of NK cells.

Composition

NK Cell Initial Flask
NK Cell Initial Medium
NK Cell Initial Cock
NK Cell Subculture Medium

Other supplies required

Ficoll-Paque (GE Healthcare, Sweden)
Sterile PBS
FBS or autologous plasma (It is desirable to be heat-inactivated at 56℃ for 30 minutes)
Sterile conical centrifuge tubes

GIST-T1 Culture Kit

Intended Use

Human Cell Line GIST-T1 Culture Kit

Background

Gastrointestinal stromal tumors (GISTs) are one of the submucosal tumors, occuring in the stomach, the small intestine and the esophagus, unlike most gastrointestinal tumors. GISTs are considered to arise from the interstitial cells of Cajal, the pacemaker cells of the gut.

GIST-T1 is a cell line derived from GISTs of the stomach in a Japanese woman and established by Takahiro Taguchi; associate professor, Graduate School of Integrated Arts and Sciences, Kochi-University, Kochi, Japan.

General Information

Organism: Homo sapiens, human
Tissue: Stomach
Cultural Properties: Adherent
Biosafety: Level 1
Gender: Female
Ethnicity: Asian
Virus Check: HIV-1(-), HTLV-1(-), HBV(-), HCV(-), T.pallidum(-)
Quality Check: Mycoplasma (-)

Composition

- GIST-T1, cryopreserved : 1.0×10^6 cells / 1vial
- Culture Medium : 250 mℓ

Materials required but not provided

- Variable volume pipettes
- Culture vessels
- 0.25% Trypsin
- HBSS or PBS(-)

Reference

Takahiro Taguchi *et al.*, , Lab Invest.82(5):663-5, May(2002)

Precautions

- Since cells are derived from human tissue, please always wear gloves and safety glasses when working with them.
- Upon receival of the kit, remove the cryovial from the dry ice packaging and immediately place it into liquid nitrogen storage until use.
- Based on the license agreement of Techno network Shikoku and Kochi University, GIST-T1 cells are prohibited to be provided (distribution, lending, transfer, licensing, etc.) to a third party.

ACE mini INCUBATOR

Intended Use

Block incubator with latest microprocessor control

Features

- Compact size. Machine fits onto the palm of your hand.
- Display is easy-to-read.
- Built-in program function allows 9 possible combinations of temperature and time.
- Accurate and uniform temperature control. Temperature calibration function.
- The timer function of 1 minute to 99 hours 59 minutes. Alarm buzzer indicates the end of incubation.
- Alarm buzzer that automatically detects any failure in the machine.
- Complies with the safety provisions of the CE regulations.

Chitosan Nanofiber Coated Culture ware

Intended Use

For primary culturing, subculturing and tissue culturing

Background

This kit product enables culture of hepatocytes in a spheroid state, allowing for long-term culture without deterioration of hepatocyte function. (Depending on the condition of the hepatocytes used and various other factors, the quality of cultured hepatocytes and the experimental results may vary in certain cases.

Note: When using the kit, always wear protective laboratory clothing, disposable gloves and safety goggles.

Composition

Cover Slip 13㎜ φ, 5 pc

CNT Coat Dish

Intended Use

Carbon Nanotube Coated Dish

Background

CNT coated dishes are polystyrene dishes with cell culture vessels with wet-coated CNTs.

To the naked eye, the CNTs are effectively transparent. However, when viewed through an electron microscope, CNTs combined in a random mesh structure can be seen. This mesh structure is the scaffold for cells and can be used to verify improvement in the culturing function. The CNTs themselves are extremely thin, with diameters of about 1㎚, but the network itself is comprised of a bundle of several CNTs.

As for the cell proliferation mechenism, the CNTs themselves, which are the scaffold for cells, are extremely compatible with FBS and other serums, and it is thought that FBS components are absorbed effectively on the CNT network.

Also, with CNT coated dishes using single-walled CNTs (SWNT FH-p), proliferated cells can be easily removed, and if cell recovery is done in the usual way, the single-walled CNTs barely come away form the dish at all.
For adherent cells like osteoblast cells, excellent effects have been seen when serum concentration is low.
Also, the CNT network structure provides conductivity, and if electrodes are installed in the base, electric stiumulation can be easily given to the cells.

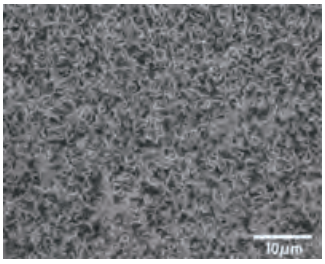
Atelocollagen coated β-TCP scaffold

Intended Use

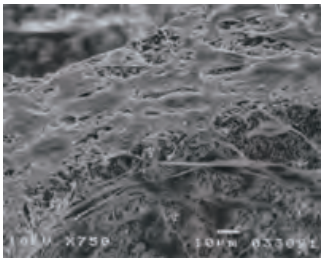
- For osteogenic research
- Bone remodeling studies (cell culture of osteoblast, osteoclast etc.)
- Functional analyses of osteogenesis related factors (bone morphogenetic proteins (BMPs) etc.)

Background

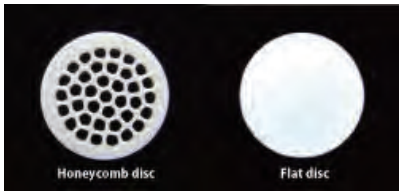
β-calcium phosphate (β-TCP) is generally used as bone prosthetic material due to its superior osteoconductive property. β-TCP is coated with atelocollagen that shows high biocompatibility. Atelocollagen coated β-TCP scaffold acts as a carrier for cell culture and transplant, and is suitable for *in vitro* /*in vivo* osteoinduction experiments using osteogenesis related factors.

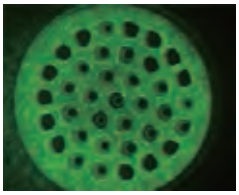


SEM image of Atelocollagen coated β-TCP scaffold surface.



SEM image of cells inoculated on Atelocollagen coated β-TCP scaffold.





Micrograph of cells inoculated on Atelocollagen coated β-TCP scaffold (Living cell staining).

Composition

Two types of dishes, honeycomb and flat are included (5 pieces each)

Origin of collagen

Atelocollagen derived from Bovine dermis

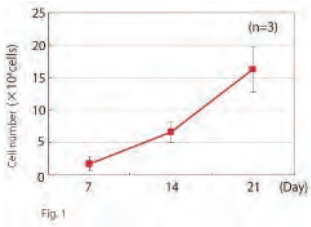


Fig. 1

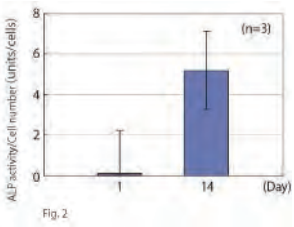

Fig. 2

MC3T3-E1 cells were inoculated on Atelocollagen coated β-TCP scaffold (using MEMalfa including 10% FBS). Cell number and gene expression level of bone differentiation markers were analyzed.

Atelocollagen, Bovine dermis

Intended Use

Collagen solutions for cell and tissue culturing

Background

Collagen solution for cell and tissue culturing is highly Purified collagen solution manufactured in KOUKEN (Tokyo) advanced technology with excellent quality control.
Cell and tissue cultures with Koken collagen solutions can express cellular functions like *in vivo* cells. Collagen not only plays the role of physical scaffold for the proliferating cells, but also enhances cell adhesion, proliferation and function. Collagen creates a natural extracellular environment that is important for cell communication and layer formation. The synthesizing capability of albumin, a function shared among hepatocytes, is maintained at a high level when cultured on plates coated with collagen solution. When skin fibroblasts are cultured three-dimensionally on collagen gel, the whole collagen contracts from the contractility of the cells producing a dermis model that closely resembles the structure of live dermis.

Delivery Note

The product contains bovine collagen. It is supplied from Australia/New Zealand and is certified about its non-hazardous by each quarantine. Please confirm the possibility of importing such bovine related item in your country before ordering.

Collagen solutions for cell and tissue culturing

Background

Collagen solution for cell and tissue culturing is highly Purified collagen solution manufactured in KOUKEN (Tokyo) advanced technology with excellent quality control.
Cell and tissue cultures with Koken collagen solutions can express cellular functions like *in vivo* cells. Collagen not only plays the role of physical scaffold for the proliferating cells, but also enhances cell adhesion, proliferation and function. Collagen creates a natural extracellular environment that is important for cell communication and layer formation. The synthesizing capability of albumin, a function shared among hepatocytes, is maintained at a high level when cultured on plates coated with collagen solution. When skin fibroblasts are cultured three-dimensionally on collagen gel, the whole collagen contracts from the contractility of the cells producing a dermis model that closely resembles the structure of live dermis.

Features and Advantages

- All products are sterilized. The used collagen are extracted from bovine dermis, solubilized and purified by our original methods.
- Acidic solutions, I-PC and I-AC, form fibrils when being neutralized at 37℃

Application

- Collagen coating of culture plates
- Three dimensional culture in a collagen gel
- Culture on a gel

Delivery Note

The product contains bovine collagen. It is supplied from Australia/New Zealand and is certified about its non-hazardous by each quarantine. Please confirm the possibility of importing such bovine related item in your country before ordering.

Type I and II Collagen

Intended Use

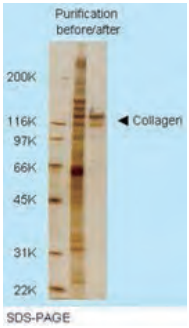
Collagen solutions for cell and tissue culturing

Background

Natural form of human type 1 atelo-collagen derived from nomal human fibroblast cell culture. It is not recombinant but naturally occurring type

Feature and Advantages

Soluble collagen released in the culture conditioned medium.
Only two bands of α1 and α2 chains are detected in a electrophoresis. It doesn't contain β and γ chains.
About β and γ chains: Collagen molecules consist of two α1 chains and one α2 chain and form a triple helix structure. When a tissue-extracted collagen sample is applied to SDS-PAGE, several bands representing binding of α chains to β and γ chains can be detected in addition to the bands representing α1 chain and α2 chain. Our collagen product does not contain β and γ chains.



Specification

Concentration 1㎎/㎖
Purity Single band in SDS-PAGE
Content: Not less than 98%
Product Code/Amount EC1-R105/0.1 ㎎

Atelocollagen, Permeable Membrane for 6-well, 24-well Culture Plate

Background

Permeable collagen membrane is specially developed from highly purified bovine dermal type I Atelocollagen for single and double layer tissue culture. It is particularly suitable for studying the molecular interactions between two different cell types by culturing on both sides of the membrane. It may be applied for the study of artificial organs and in the emerging field of tissue engineering. The membrane is permeable and allows free passage of amino acids and small molecules, which is important for the absorption and exchange of molecules through the membrane using cell polarity.

This Collagen membrane is available for use with both 6 and 24-well culture plates.

Features and Advantages

- Membrane transparency enables microscopic observation of cells while culturing.
- Study of cell interaction is possible without co-culture.
- Cell culture in a collagen membrane creates a natural environment that resembles *in vivo* conditions.
- Collagen membranes is available for use with both 6 and 24-well culture plates.
- All products are manufactured under stringent quality control.
- All product are sterilized.

Delivery Note

The product contains bovine collagen. It is supplied from Australia/New Zealand and is certified for its non-hazardous. Please find out whether you can import bovine-related item into your country before ordering.

Atelocollagen membrane

Atelocollagen, membrane for 6-well culture plate (left) and 24-well culture plate (right)

Application

- Study of interaction between cells
- Fundamental research of artificial internal organs
- Screening of medicine efficacy
- Study of cell metabolism and mechanism

Collagen Sponge

Intended Use

Useful tool for three dimensional culture and research of tissue engineering as a 3D scaffold

Background

The collagen sponge for cell culturing is a collagen-based device developed for three-dimensional cell culturing. The collagen porous sponge is prepared from a insoluble type I collagen that is derived from bovine Achilles tendon. Cells can penetrate into the sponge and proliferate three-dimensionally. This technique is very useful for tissue engineering studies.

Application

Three dimensional culturing
Tissue engineering

Delivery Note

The product contains bovine collagen. It is supplied from Australia/New Zealand and is certified about its non-hazardous by each quarantine. Please confirm the possibility of importing such bovine related item in your country before ordering.

Atelocollagen Honeycomb sponge

Intended Use

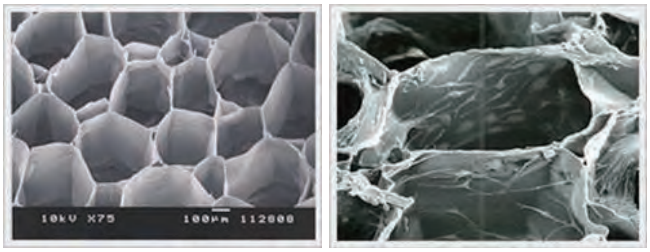
Useful tool for three dimensional culture and research of tissue engineering as 3D scaffolds

Background

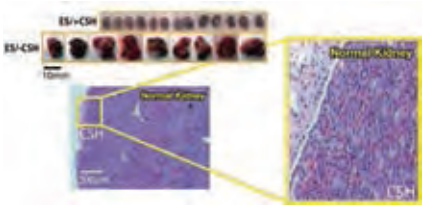
The 'Honeycomb' collagen sponge has a structure in which uniform pores (200-400 ㎛) are arranged densely in one direction, into which cells can penetrate and proliferate. This structure facilitates the ready supply of nutrients to the cells inside the sponge, and releases metabolic wastes and biochemical products. Cells can proliferate and fill the lumen to form a uniform cell mass.

Delivery Note

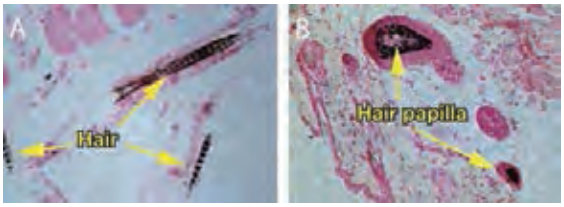
The product contains bovine collagen. It is supplied from Australia/New Zealand and is certified about its non-hazardous by each quarantine. Please confirm the possibility of importing such bovine related items in to your country before ordering.



Electron microscope image of mouse fibroblast cell culture in Honeycomb collagen sponge



Pathological obervation at 12 weeks after the transplantation confirmed that none of th eEB adhered to KOU-CSH-10 (ES/+CSH) generated a teratoma, whereas teh ES cell-derived EB transplanted without KOU-CSH-10 (ES/-CSH) generated a teratoma in all mice. ES/+CSH transplanted in the mouse kidney did not look different from the adjacent normal renal tissue in histopathological image and spontaneously differentiated into the tissue without a specific differentiation induction (Coutesy of Dr. Mariko Yamaki, Matsumoto Dental University)



Hairs (A) and hair papillas (B) were clearly observed in all mice. (Coutesy of Dr. Mariko Yamaki, Matsumoto Dental University)

Atelocollagen sponge Mighty

Intended Use

For three-dimensional culture and research of tissue engineering as 3D scaffold

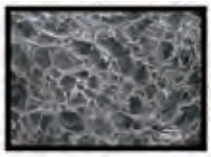
Background

Atelocollagen is a collagen solubilized by protease, but its physical properties are virtually identical to those of natural, unsolubilized collagen. Furthermore, atelocollagen additionally has superior characteristics

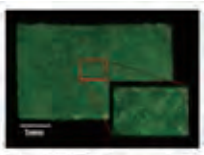
Features and Characteristics

1. Made from highly purified type I atelocollagen derived from bovine dermis.
2. Type I collagen is a major extracellular matrix and provides a scaffold for cultured cells.
3. Stands well to cyclic compression loading (repeated 10-20kPa load) and maintains constant strength enough to withstand compressive loading of up to 30 kPa (single time).
4. Applicable to a scaffold for three dimensional culturing
5. Suitable size for 96-well plates
6. Culturing cells in MIGHTY under cyclic compressive loading (cyclic load of 10 to 20 kPa) provides more *in vivo*-like environment to evaluate cell function. MIGHTY is also applicable as a scaffold for conventional 3D cell culture.

▲Strength to withstand a stress of 50kPa load



▲SEM image of cross section through "MIGHTY"



▲Cross-sectional image of "MIGHTY" seeded with Mouse Fibroblast cell (NIH3T3)

Low antigenicity

A collagen molecule has an amino acid sequence called a telopeptide at both N and C termini, which confers most of the collagen's antigenicity. Atelocollagen obtained by protease treatment is low in immunogenicity because it is free from telopeptides.

High purity

Atelocollagen is generally obtainable with a high degree of purity by protease degestion, which breaks down other protein contaminations.

High biocompatibility

Atelocollagen is biodegradable. Therefore, atelocollagen is used in a variety of fields such as medicine, medical devices and cosmetics as a raw material, and research in cell culture.

High placiticity

Atelocollagen can be engineered into many different physical shapes such as films, sponge-like structure, string-like configurations, powders and gels. It is possible to leverage the special properties of atelocollagen to produce the most appropriate configuration for any application. For example, atelocollagen is normally insoluble in water with neutral pH, but this characteristic can be altered to make it soluble. It is also possible to use atelocollagen equally as a coagulant or as an anticoagulant, and to control the rate at which it is absorbed by the body.

High safety

We ensures the safety of materials through the precise management of each and every bovine used as a source of material for atelocollagen production;

1. The bovine dermis used comes from Australia which has a national livestock traceability system in place. Only calves aged six months or younger are used.
2. Animal feed derived from bovine and sheep are not used. Only BSE-free, safe feed is used.
3. Only the dermal layer of the skin is used, which is classified as belonging to the "no detectable infectivity" category (WHO Guidelines on Tissue Infectivity Distribution in Transmissible Spongiform Encephalopathies). Great care is taken to prevent this layer from coming into contact with hazardous sites including the brain and the spine during collection.
4. Bovine used for KOKEN's collagen is trackable to their birthplace, and field research is conducted periodically.

Derived from

Consists primarily of type I atelocollagen derived from bovine dermis.

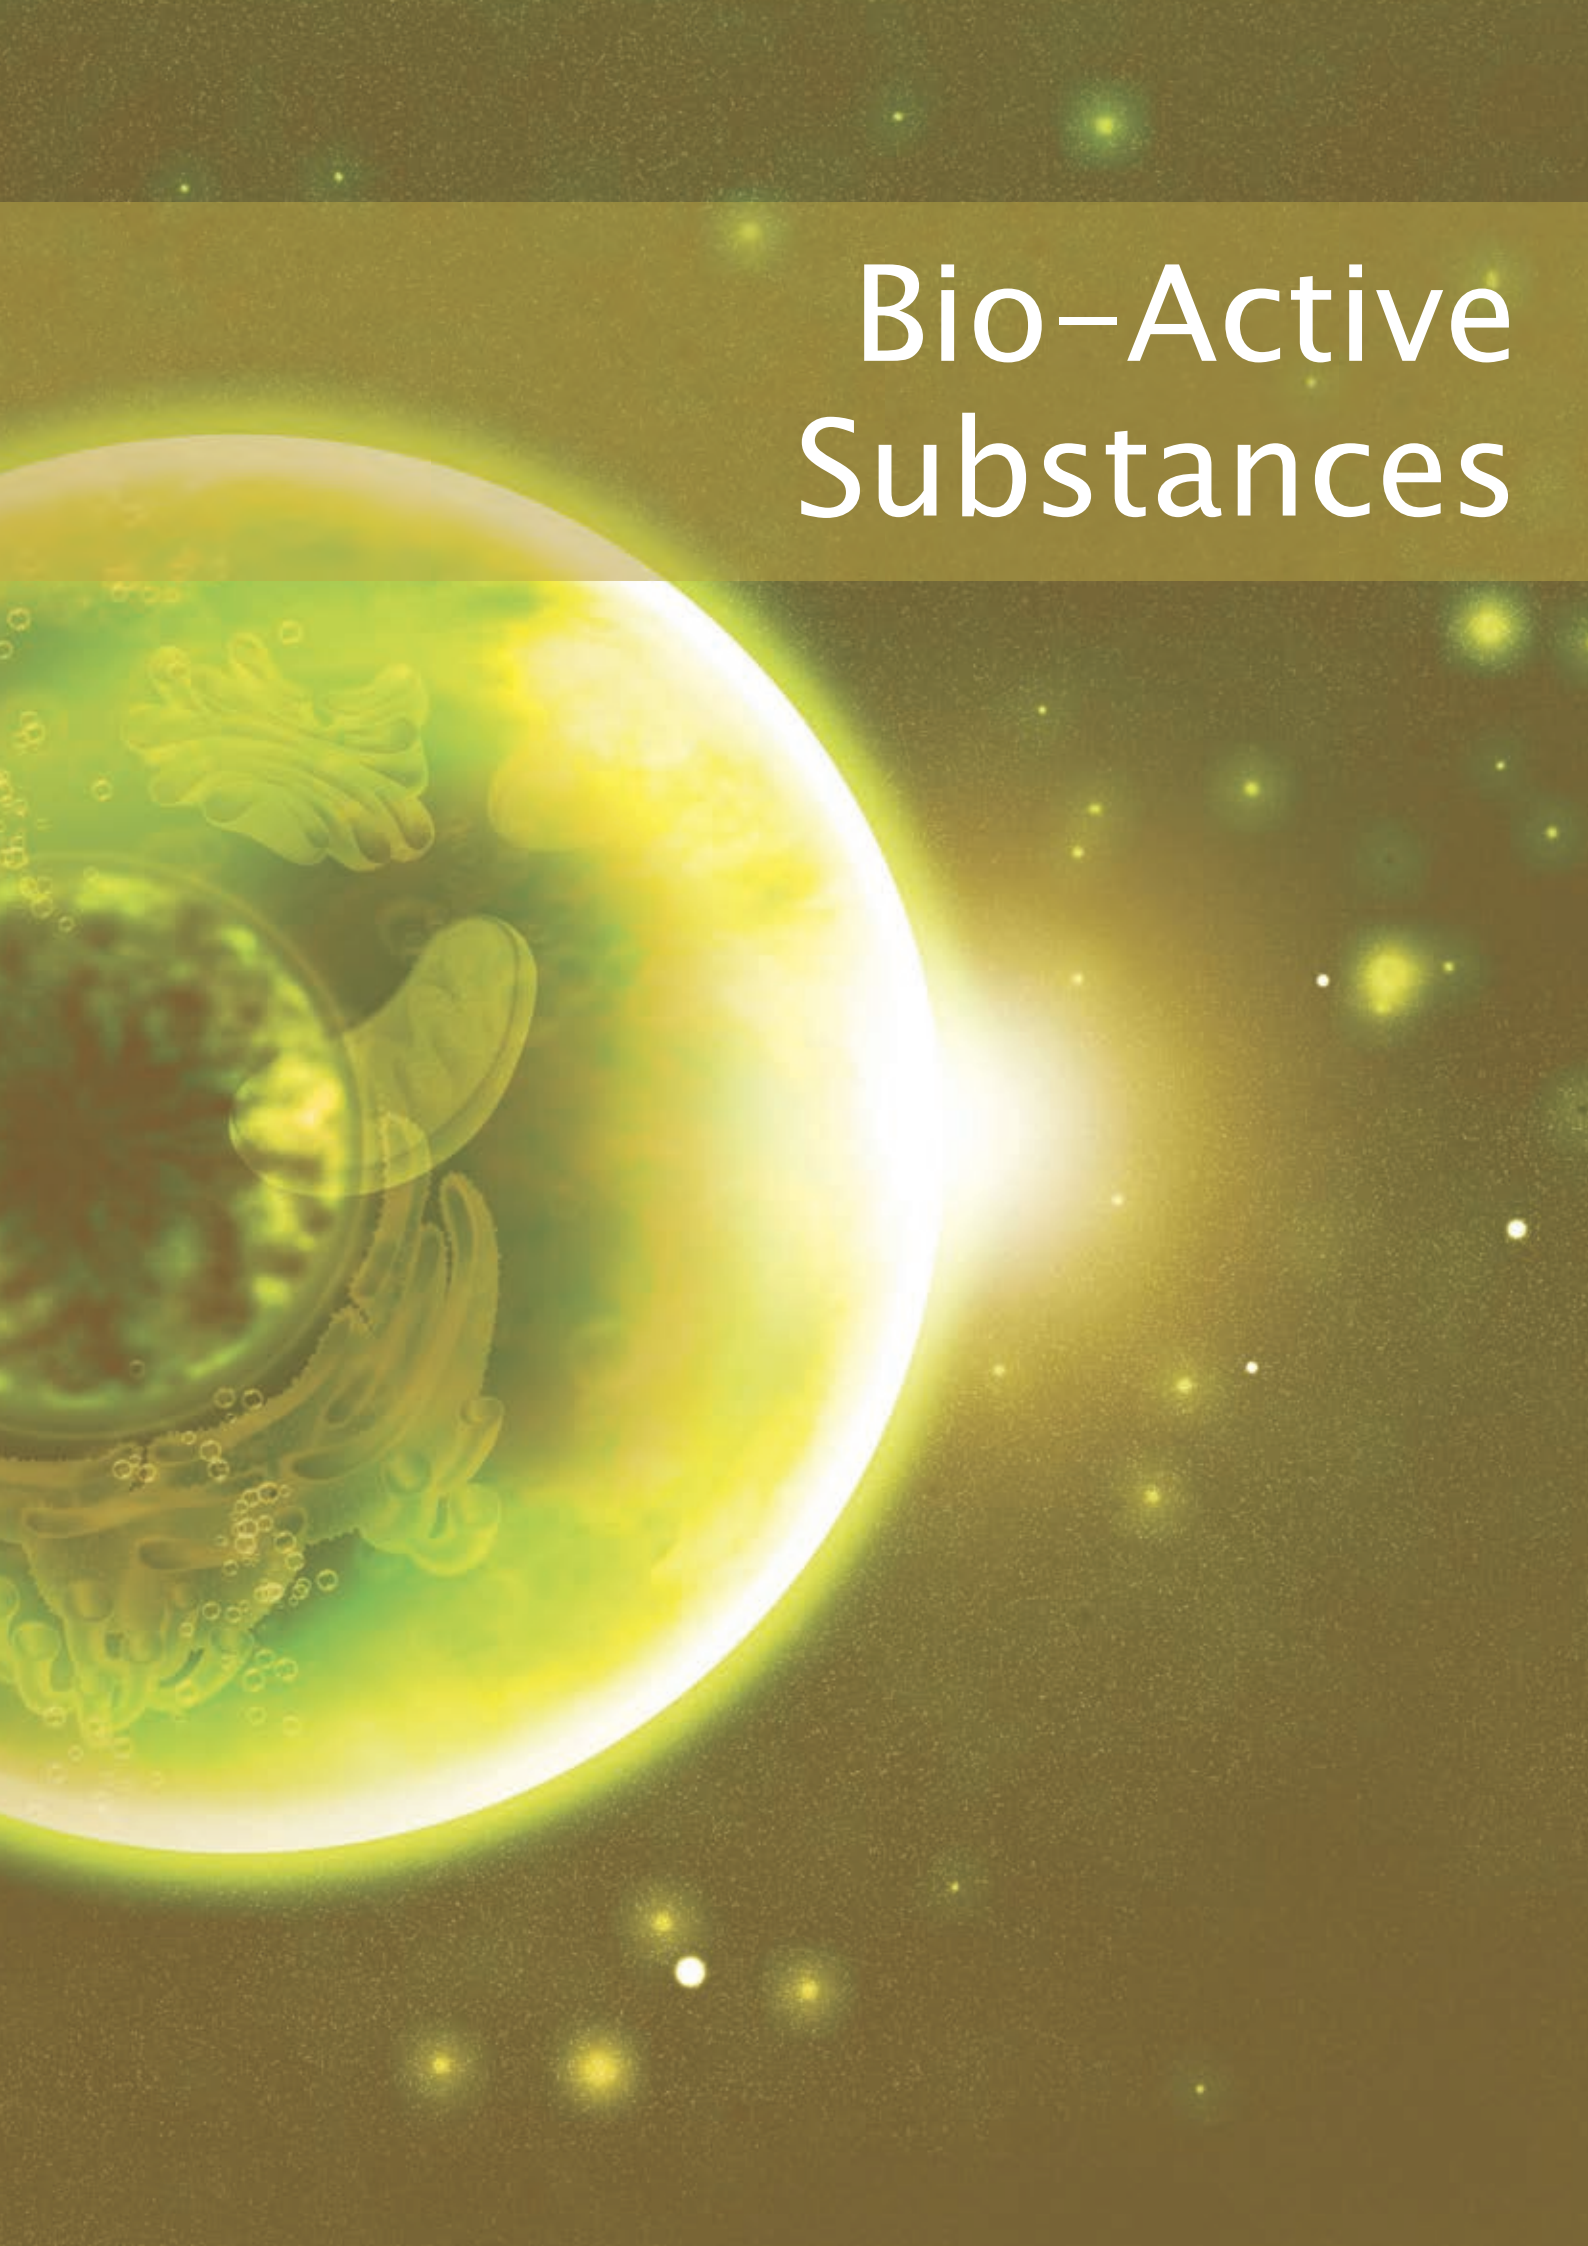
COSMO BIO CO., LTD.

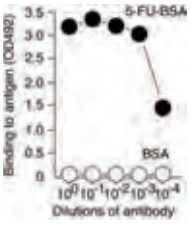
Bio-Active Substances



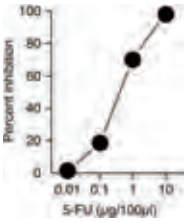
5-FU-BSA

Intended Use

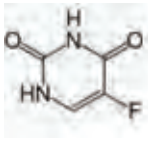
Direct ELISA
Competitive ELISA



Monoclonal antibody (H3-17) shows high binding to 5-FU-BSA but undetectable binding to BSA.
Different dilutions of antibody were tested for binding to immobilized antigens (100 ng / well) in a direct ELISA.



Monoclonal antibody (H3-17) is capable of binding to free 5-FU.
Free 5-FU efficiently inhibits the antibody binding to immobilized 5-FU-BSA (5 ng / well), which was detected by a competitive ELISA.



CAS.No.	51-21-8
Molecular Formula	C4H3FN2O2
Molecular Weight	130.08

Description

5FU / BSA molar ratio 11.91.

Concentration

1 mg/mℓ

Note: This conjugate was dialysed against PBS.
The dialysate was then frozen at -80 ℃.

HBsAg with high antigenic activity (HBsAg-XT)

Background

The Hepatitis B virus surface antigen (HBsAg) is composed of L-, M- and S-antigen. Among them S-antigen activity is known to be the major antigen of human derived HBsAg. This product is specifically designed to exhibit high S antigen activity. Using ELISA analysis to detect S-antigen activity, the product showed almost equal antigen activity to that of partially purified HBsAg derived from HVB patients. The antigen resembles in structure to that of HBsAg derived from HBV patients, but is free from potential HBV infections, and thus can be used not only as a S-antigen but also to mimic HBsAg.

Structure

Nano size particles having antigen protein floating in lipid bilayer. The mean particle size is 50 to 60 nm as determined dynamic light scattering methods (20 nm as determined by electron microscopy).

Form

Lyophilized white powder

Content

30 μg (BCL-AGX-01), 360 μg (BCL-AGX-02), or 1 μg (BCL-AGX03) (dissolving instruction: For 30 μg vial, added 100 μℓ of water to the vial that makes an antigen solution at 300 μg /mℓ in PBS (137mM NaCl, 8.1mM Na_2HPO_4 $12H_2O$, 2.68mM KCl, 1.47mM KH_2PO_4, pH 7.2 - 7.4) containing 1% sucrose. For 360 μg vial, added 500 μℓ of water to the vial that makes a antigen solution at 720 μg/mℓ in PBS (137mM NaCl, 8.1mM Na_2HPO_4 $12H_2O$, 2.68mM KCl, 1.47mM KH_2PO_4, pH 7.2 - 7.4) containing 1% sucrose.)

RecA Protein	BAM-01-001EX	100 μg

LexA repressor

Background
E. coli LexA protein binds specifically to the SOS-box sequence and represses the genes belonging to the SOS regulon. In response to DNA damage, RecA protein is activated by ss-DNA accumulated in the damaged cells and promotes autocleavage of LexA repressor by its coprotease activity. DNA repair genes and error prone polymerases are induced, and DNA damage is repaired and mutation is induced. The lexA gene is used for yeast two-hybrid experiments as a target to identify the protein-protein interaction *in vivo*.

Usage
1) Studies on the mechanism of *E. coli* SOS response.
2) Used as an antigen for positive control in Western blotting to confirm that the Bait construct is expressed stably in the nucleus as protein of the expected size in the yeast two-hybrid method using the lexA gene.

Specification
Purity: Over 90% by SDS-PAGE (CBB staining) Protein concentration: 0.8 mg/mℓ as measured by BCA method

Form
50% glycerol, 10 mM Tris-HCl (pH 7.5), 2 mM EDTA, 100 mM NaCl, 5 mM mercaptoethanol

Cell Signaling

Intended Use

- Research for DNA replication, recombination and repair.
- Identification of proteins that interact with PCNA.
- Useful for studying autoimmune diseases such as systemic lupus erythematosus.

Background

Proliferating cell nuclear antigen (PCNA) is a 36 kDa homotrimeric protein known to act as a co-factor for DNA polymerase δ, which is responsible for leading strand DNA replication. PCNA was originally identified as an antigen that is expressed in the nuclei of cells during the DNA synthesis phase of the cell cycle. A cell cycle-dependent protein called cyclin was shown to be identical to PCNA. Crystal structure data suggests that a PCNA homotrimer ring can encircle and slide along the DNA double helix. Multiple proteins involved in DNA replication, DNA repair, and cell cycle control bind to PCNA rather than directly associating with DNA, thus facilitating fast processing of DNA. PCNA is a useful marker for DNA synthesis and is highly conserved among most species. Human PCNA was over-expressed in *E. coli* as a recombinant full-size protein without any tag and highly purified.

Labiase™ Bacterial Cell Lytic Enzymes

Intended Use

Digestive enzyme of cell walls of lactic acid bacterium

Background

Labiase™ , produced by a submerged culture of Streptomyces fulvissimus TU-6, is a new enzyme that lyses cell walls of numerous lactic acid bacterium effectively. This enzyme is used as a tool for studies of cell walls structure of lactic acid bacterium and preparation of plasmid DNA, intracellular enzyme and protoplasts from lactic acid bacterium.

Storage

Lyophilized preparation is stable for at least 1 year when stored at 4℃

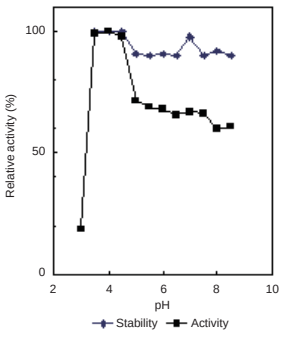

Fig.1 pH-stability and activity
Stability:18 hours treatment at 25℃
Activity:37℃

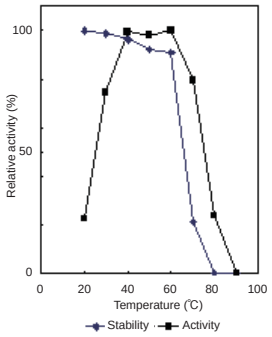

Fig.2 Thermal-stability and activity

Yatalase™ Fungal Cell Lytic Enzymes

Background

Yatalase is used to lyse cell walls of filamentous fungi. The product is prepared from culture supernatants of Corynebacterium sp. OZ-21 and consists mainly of chitinase, chitobiase and β-1,3-glucanase.

Features and Advantages

- Has excellent thermostability and can be stored at room temperature.
- Efficiently digests native chitin.
- Has the revitalization of Chitinase, Chitobiase, Chitosanase, and β-1,3-Glucanarse
- Can be used alone to prepare protoplasts from filamentous fungi.

Specific Activities

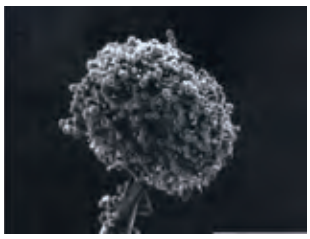
Chitinase activity : Approximately 50 units / g powder
Chitobiase activity : Approximately 500 units / g powder
Lytic activity against cell walls : Approximately 10,000 units/ g powder

Table 1 Enzyme activities found in Yatalase

Enzyme activity	Activity (units/g power)
Chitinase	50
Chitobiase	500
Chitosanase	19
-1,3-glucanase	300
Protease	31
Cell-well lysing activity	10,000

Table 2 Yields of protoplasts

Species	Yield of protoplasts (× 10⁸ wet cells)
Aspergillus oryzae	70
Aspergillus kawachi	2
Aspergillus terreus	21
Penicillium citrinum	20
Penicillium lanosum	50
Trichoderma koningii	100
Monascus sp.	14
Mucor hiemalis	8
Rhizopus nigricans	21
Pleurotus ostreatus	11
Coprinus cinereus	20
Lentinus edodes	2



Unit Definition

Chitinase activity:
One unit of chitinase activity is determined as the amount required to release 1 μmol of N-acetylglucosamine from chitin in 1 minute.

Chitobiase activity:
One unit of chitobiase activity is definedas the amount ofenzyme required to release 1 μmol of p-nitrophenol from p-nitrophenyl-N-acetyl-β-D-glucosaminide in 1 minute.

Lytic activity:
One unit of enzyme activity is defined as the amount required to cause a 1% decrease in absorbance in 1 hour.

Specification

Source
Corynebacterium sp. OZ-21
Package Size 2 g

Westase™ Yeast Cell Lytic Enzymes

Intended Use

Digestive enzyme of cell walls of yeast

Background

Westase was prepared from liquid culture supernatant of Streptomyces rochei DB-34. This product has complex lytic activities of yeast cell mainly consisting of β-1,6 glucanase and β-1,3 glucanase activity.

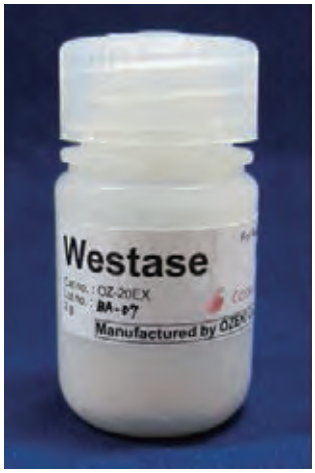
This enzyme works well for Ascosporogenous yeasts such as Saccharomyces cerevisiae. However, it is also available for fission yeasts such as Schizosaccharomyces pombe which cannot be protoplasted just with Zymolyase treatment or Basidiosporogenous yeasts, Imperfect yeasts such as Ustilago maydis, Phaffia rhodozyma, and Cryptococcus albidus which are rarely protoplasted, and make them efficiently into protoplasts.

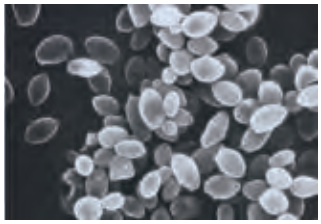
Definition of Activity

β-1,6 glucanase activity
One unit is defined as the amount required to release 1 μmol reducing sugar from 10 mg/mℓ Pustulan solution in 1 min. at 37℃, pH6.0.

Lytic activity

One unit is defined as the amount required to cause a 1% decrease in absorbance at 660 nm in 1 min. at 30℃, pH6.0 when using cell wall fraction of Cryptococcus albidus IFO 0612





Specific activities

β-1,6 glucanase activity : >400 units / g
Lytic activity : >35,000 units / g
DNase activity : ND (McIlvain Buffer, pH6.0)

Storage

Lyophilized preparation is stable for at least 1 year when stored at 4℃.

Appearance

Lyophilized powder (containing celite as the excipient)

Westase™ Yeast Cell Lytic Enzymes	OZK-OZ-20EX	2 g

HBsAg L-protein-ST

Background

Hepatitis B virus (HBV) expresses three types of surface antigens, i.e. S-, M-, and L-protein. L-protein is composed of S-, Pre-S2, and Pre-S1 region. The deletion of Pre-S1 region Forms M-protein and further deletion of Pre-S2 region results in S-protein. Most of commercially available HBsAg is composed of either S-protein alone or a mixture of S- and M-proteins. HBV-infected patients generally possess antibody against S-protein, since most circulating antigen is S-protein. HBsAgL-protein-ST type contains all the three components in one protein. The S-protein region, however, is so modified that the regular human antibody to S-protein does not recognize. The Pre-S1 and Pre-S2 region is intact and shows high antigen activity.The Pre-S1 region is known to be the hepatic cell recognition site and to be important in the HBV infection. And Pre-S2 region is also known to play important role in HBV infection. Thus, the product can be used as a unique tool to investigate the mechanism of HBV infection as well as antigens for both Pre-S1 and Pre-S2. The product is also used as an antibody-escapable mimic antigen.

Purity
over 95% (see SDS-PAGE data)

Source
Yeast (*Saccharomyces cerevisiae*)

Appearance
Lyophilized white powder

Activity
Pre-S1 activity is approximately 1000 units / mg protein (One unit is an arbitrary scale which is determined by using Pre-S1detecting ELISA system developed by Beacle)

Description	Cat. No.	Quantity

Hepatitis B Virus Surface Antigen (HBsAg), L-protein

Intended Use

The immunological study in HBV and the research of the infection mechanism

Background

Hepatitis B virus (HBV) expresses three types of surface antigens, i.e. S-, M-, and L-protein. L-protein is composed of S-, Pre-S2, and Pre-S1 region. The deletion of Pre-S1 region forms M-protein, and further deletion of Pre-S2 region results in S-protein. Most of commercially available HBsAgs is composed of either S-protein alone or S- plus M-proteins. This product, HBsAg, L-protein contains all the three components in one protein. The Pre-S1 region is known to be the hepatic cell recognition site and to be important in the HBV infection. Thus, the product can be used as a mimic HBV for immunological studies or as a tool for studying infection mechanism.

Structure
Nano size particles having antigen protein floating in lipid bilayer. The mean particle size is 60 to 70nm as determined dynamic light scattering methods (20nm as determined by electron microscopy)

HIV-1 Gag p15

Intended Use

- A substrate for HIV-1 protease in the presence of HIV-1 genomic RNA.
- For studies of structure and function of the AIDS virus as a precursor of nucleocapsid p7 protein that binds to HIV-1 genome RNA.
- It can be used as a p15 antigen to detect the anti-HIV-1 p15 antibody in Western blotting or ELISA.
- A standard for the quantitative analysis of the HIV-1 p15 antigen.

Background

HIV-1 Gag p15 is processed by the digestion of its precursor Gag p55 by HIV-1 protease. This protein is further digested into nuclocapsid protein p7 and into p6 and p1 of unknown function. This digestion is promoted by the bindingof HIV-1 genome RNA and the two Zn finger motifs that exist in the p7 region. The produced nucleocapsid protein p7 regulates the RNA function by directly binding to HIV-1 genome RNA. The product is over-expressed as a recombinant protein in *E.coli* with a plasmid carrying the Gag p15 coding region of HIV-1 virus, subtype B, and highly purified by several steps of chromatography. Its molecular size is 15 kD, same as that of p15 purified from AIDS virus particles.

Purity

HIV-1 Gag p17

Intended Use

- p17 antigen to detect anti-HIV-1 p17 antibody in Western blotting or ELISA.
- Standard for quantitative analysis of HIV-1 p17 antigen.
- For studies of structure and function of the AIDS virus as matrix protein that constitutes HIV-1 core.

Background

HIV-1 Gag p17 is the matrix protein of AIDS virus HIV-1 and is processed by the digestion of its precursor Gag p55 by HIV-1 protease. This protein is indispensable to the reproduction of AIDS virus and constitute the essential element of the of AIDS virus particle construction. The product is over-expressed as a recombinant protein in *E. coli* with a plasmid carrying the Gag p17 coding region of HIV-1 virus, subtype B, and highly purified by several steps of chromatography. Its molecular weight is 17 kD, same as that of p17 purified from AIDS virus particles.

Purity
Over 90% by SDS-PAGE (CBB staining)

Protein concentration
0.23 ㎎/㎖ as measured by BCA method

HIV-1 Gag p24

Intended Use

- Standard in titration of p24 antigens as it indicates the amount of HIV-1 virus. This measurement is useful for diagnosis of virus infection and assessing the amount of virus during and after treatment.
- An antigen for Western blotting or ELISA of anti-HIV-1 p24 antibody.
- For studies of structure and function of HIV-1 virus as it constitutes HIV-1 core as a capsid protein.

Background

HIV-1 Gag p24 is a capsid protein that constitutes the core of AIDS virus, HIV-1, and is produced by digestion of its precursor, Gag p55, by HIV-1 protease. This protein is indispensable for reproduction of AIDS virus and constitutes an essential element in the virus particle. As this protein is detectable from the early stage of AIDS virus infection, and reflects the amount of virus in the blood, it is used as a marker for observing the patient's condition during and after treatment.
This protein was over-expressed as a recombinant protein in *E. coli* with a plasmid carrying the Gag p24 coding region of HIV-1 virus, subtype B, and highly purified by several steps of chromatography. Its molecular weight is 24kD, same as that of p24 purified from HIV-1 virus particles.

Purity
Over 90% Purity by SDS-PAGE (CBB staining)

Protein concentration
1 mg/mℓ measured by BCA method

Form
50% glycerol, 20 mM Tris-HCl (pH7.5), 50 mM NaCl, 10 mM mercaptoethanol

Measurement of the activity
The ED50 as determined by a cell proliferation assay using MTS assay kit (CellTiter 96, Promega) with human keratinocytes JCRB141 cells was <10 ng/mℓ.

HIV-1 Gag p55

Intended Use

- A substrate for the HIV-1 protease activity assay.
- To detect anti-HIV-1 Gag antibody in Western blotting or ELISA. All the anti-HIV-1 Gag antibodies such as anti-p17 antibody, anti-p24 antibody and anti-p15 antibody can be measured at the same time.

Background

HIV-1 Gag p55 is a precursor protein of several proteins that form the core structure of AIDS virus, indispensable to its reproduction. This protein is digested by HIV-1 protease, first into intermediate products p41 and p15. Thenp41 is digested into matrix protein p17 and capsid protein p24. Protein p15 is further digested into nucleocapsid protein p7 and to p6 and p1 both of unknown function. The product is over-expressed as a recombinant protein in *E. coli* with a plasmid carrying the Gag p55 coding region of HIV-1 virus, subtype B, and highly purified by several steps of chromatography. Its molecular weight is 55 kD, same as that of p55 purified from AIDS virus particles. The protein bands at lower positions are degradation products of p55 which could not be separated during purification steps.

HIV-1 Nef

Intended Use

- For functional studies of HIV-1 Nef protein.
- A standard for the titration analysis of HIV-1 Nef antigen.
- A Nef antigen in detection of anti-HIV-1 Nef antibody by Western blotting or ELISA.

Background

HIV-1 Nef is one of the accessory proteins synthesized in the early stage of AIDS virus reproduction and is abundantly found in infected cells. The protein interacts directly with the signal transduction protein of the host T cell and works effectively on AIDS infection or on long term survival of the infected cells or induces apoptosis of non-infected cells. It is also involved in the endocytosis and degradation of receptor protein of the cell surface such as CD4 and MH4, important for AIDS virus infection. The product is over-expressed as a recombinant protein in *E. coli* with a plasmid carrying the nef gene of HIV-1 virus, subtype B and highly purified by several steps of chromatography. Its molecular size is 27kD, like that of Nef purified from AIDS virus particles (Fig 1).

HIV-1 Reverse transcriptase

Intended Use

- For the screening of specific inhibitors for new AIDS treatment.
- Gag and Env proteins are employed as antigens for detecting anti-HIV-1 antibody. However, by using this enzyme in combination as an antigen, the detection will be more sensitive.
- For the first step of RT-PCR reaction for converting RNA to DNA. The HIV-1 reverse transcriptase can also be applied for RT-PCR method.
- Standards for SDS-PAGE (Fig.1), Western blotting (Fig.2), Dot blotting, ELISA.

Background

HIV-1 reverse transcriptase is an RNA-dependent DNA polymerase of HIV-1 (AIDS virus), subtype B origin. It also has RNaseH activity and is an enzyme indispensable to the reproduction of AIDS virus. The product is uniquely over-expressed as a recombinant protein in *E. coli* by a patented method and highly purified. It is composed of two subunits (molecular weight of 66 kD and 51 kD), like the enzyme purified from AIDS virus particles (Fig 1).

Purity

Over 90% by SDS-PAGE (CBB staining)

Protein concentration

0.37 ㎎/㎖ as measured by BCA method

Specific activity

10,000-20,000 units / ㎎

Streptolysin O

Intended Use

- Antigen for the measurement of anti-streptolysin 0 antibody (AS0) (diagnostic reagent).
- Reagent for membrane pore formation to introduce small to macromolecules into living cells.
  It should be handled carefully to avoid injection (mouse LD50. 8㎍/kg).

Background

Streptolysin O (SLO) is a membrane-damaging extracellular toxin produced by hemolytic streptococci. The membrane-damaging activity is measured by hemolysis of red-blood cell. SL0 is oxygen-sensitive and is easily inactivated in its presence but can be reactivated by thiol compounds, so it is also called thiol-activated cytolysin. SL0 is produced not only by Group A hemolytic streptococci but also by Group C and Group G strains. The amino acid sequences are highly conserved among them and their homology is over 98%. The product was highly purified from *E.coli* over-expressing SL0 of Group C hemolytic streptococci. The specific activity is as high as >900,000 hemolytic units (HU) / ㎎ and Forms a big hole on the cell membrane, which enables the introduction of protein inside the cells *in vivo*.

Purity

Over 98% is SLO by SDS-PAGE

Medaka Vitellogenin standard for ELISA

Intended Use
Standard for ELISA

Background
Vitellogenin, the egg yolk precursor protein, is induced by estrogens. On the other hand, environmental estrogens are known to disrupt endocrine system in animals. Recently, vitellogenin has proven to be an ideal marker for enviromental estrogen.

Concentration
100 ng/mℓ

Components
Standard (100 ng/mℓ) 0.5 mℓ + dilution buffer 1 mℓ

Source
Ascites of 17 β-estradiol treated female medaka

Appearance
Clear liquid

Description	Cat. No.	Quantity
Medaka Vitellogenin standard for ELISA	EBT-MV-STD-EX	1 set

Stachybotrydial

Background
Stachybotrydial is a tripenylphenol metabolite (molecular mass of 386.5) produced by the fungus *Stachybotrys* sp.(e.g. *S.cylindrospora, S. nephrospora*).
Stachybotrydial inhibits pancreatic cholesterol esterase at IC50 of 60 μM. When administered to normal rats (100 mg / kg , po), reduced cholesterol absorption by 50-60%.
In cholesterol-fed mice, dietary supplementation of stachybotrydial (0.1%) for 14 days resulted in 20% reduction in serum total cholesterol level without causing significant change in the high density lipoprotein cholesterol level.

Stachybotrydial inhibits avian myeloblastosis virus protease, myo-inositol monophosphatase, fucosyltransferases and syalyltransferases at IC50 of 7.8 μM, 70 μM, 0.6-10 μg / mℓ and 11-21 μg / mℓ , respectively. Stachybotrydial has antiviral activity against herpes simplex virus 1 (IC50 = 4.32 μg / mℓ), anti plasmodial activity (IC50 = 0.85 μg / mℓ).
Stachybotrydial enhanced fibrin binding and activation of plasmingen (2- to 4-fold at 60-120 μM).

MW
386.48

Purity
>80% by HPLC

Other
Crystalline Powder

Chemical Formula
$C_{23}H_{30}O_5$

5-Aminolevulinic Acid hydrochloride (5-ALA)

Intended Use

5-ALA is applied in a variety of scientific fields with a wide range. Please refer to published papers for the details of specific applications.

- Application in production of Cytochrome P450
- Improvement of harvest yield or increase of plant greenness
- Supplement for culture of microorganism or cells from animals
- Research relating production of active oxygen derived from accumulation of excess amount of porphirins
- Photodynamic diagnosis for cancer research

Background

5-Aminolevulinic acid (ALA) is a compound which is widely present in the biosphere and plays an important role in the living body as an intermediate of the tetrapyrrole compound biosynthesis pathway for vitamin B12, heme, chlorophyll, etc. ALA is of interest as a biodegradable herbicide (1), an insecticide (2), a growth regulator for plants (3), a precursor of heme proteins (4), and an effective agent used in photodynamic therapy of cancer (5).

IgE, Myeloma

Quality

Purified from serum of a IgE myeloma patient by column chromatographies. This preparation is negative for HBs antigen, HCV antibody and HIV-1 antibody.

Abbreviation

H-IgE

Storage and Handling

The solution should be stored below -20℃
Repeated freezing and thawing should be avoided.

Solution

1 mg/mℓ IgE, PBS, pH,7.4 (100 μℓ)

Description	Cat. No.	Quantity
IgE, Myeloma	YMS-7677	100 μℓ

Fluoresceinamine Labeled Sodium Chondroitin Sulfate

Intended Use

For research of chondroitin sulfate

Background

Chondroitin sulfate (CS) is a sulfated glycosaminoglycan composed of repeating disaccharide units of N-acetyl-D-galactosamine (GalNAc) and D-glucuronic acid (GlcUA). CS is abundant in cartilage and exists as unbranched polysaccharidechains covalently linked to the protein core of proteoglycans. These products are prepared by the fluorescent labeling of CS derived from whale cartilage (FACS-A1), shark cartilage (FACS-C1 and D1), squid cartilage (FACS-E1) according to the method of Ogamo *et al*. Fluoresceinamine molecules are chemically attached to carboxyl groups of the glucuronic acid of CS. These solutions are dissolved in PBS (-) and sterilized by filtration. The endotoxin content is in accordance with the product specifications. The excitation wavelength is 490～500 ㎚ and the emission wavelength is 515～525 ㎚.

Specifications
3 ㎖ (1 ㎎/㎖, in phosphate buffered saline (PBS) (-))

Appearance
Yellow green solution

Fluorescent probe
Fluoresceinamine

CAS number of fluorescent probe
3326-34-9

Fluoresceinamine Labeled Sodium Dermatan Sulfate

Intended Use

For research of chondroitin sulfate

Background

Dermatan sulfate (DS) is a sulfated glycosaminoglycan composed of repeating disaccharide units of N-acetyl-D-galactosamine (GalNAc) and D-glucuronic acid (GlcUA) or D-iduronic acid (IdoUA). DS is abundant in skin and exists as unbranched polysaccharide chains covalently linked to the protein core of proteoglycans. This product is prepared by the fluorescent labeling of DS derived from porcine skin according to the method of Ogamo *et al*.1). Fluoresceinamine molecules are chemically attached to carboxyl groups of the GlcUA or IdoUA of DS. FADS-B1 contains approximately 80 % of disaccharide units with one sulfate groups as 4-O-sulfation of GalNAc. This solution is dissolved in PBS (-) and sterilized by filtration. The endotoxin content is in accordance with the product specifications. The excitation wavelength is 490～500 ㎚ and the emission wavelength is 515～525 ㎚.

Specifications
3 ㎖ (1 ㎎/㎖ , in phosphate buffered saline (PBS) (-))

Fluoresceinamine Labeled Sodium Heparan Sulfate

Intended Use

For research of chondroitin sulfate

Background

Heparan sulfate (HS) is a sulfated glycosaminoglycan composed of repeating disaccharide units of D-iduronic acid (IdoUA) or D-glucuronic acid (GlcUA) and N-acetyl-D-glucosamine or N-sulfo-glucosamine. HS is abundant in basement membrane of kidney and blood vessel exists as unbranched polysaccharide chains. This product is prepared by the fluorescent labeling of HS derived from porcine kidney according to the method of Ogamo *et al*. Fluoresceinamine molecules are chemically attached to carboxyl groups of the GlcUA or IdoUA of HS. This solution is dissolved in PBS (-) and sterilized by filtration. The excitation wavelength is 490～500 nm and the emission wavelength is 515～525 nm.

Specifications
1 mℓ (1 mg/mℓ , in phosphate buffered saline (PBS) (-))

Appearance
Yellow green solution

Fluoresceinamine labeled Sodium Hyaluronate

Intended Use

For research of chondroitin sulfate

Background

Hyaluronan (HA) is a glycosaminoglycan composed of repeating disaccharide units of N-acetyl-D-glucosamine (GlcNAc) and D-glucuronic acid (GlcUA). HA is abundant in synovial fluid, skin, umbilical cord, and vitreous body exists as unbranched polysaccharide chains. This product is prepared by the fluorescent labeling of HA according to the method of Ogamo *et al*. Fluoresceinamine molecules are chemically attached to carboxyl groups of the GlcUA of HA. This solution is dissolved inPBS (-) and sterilized by filtration. The endotoxin content is in accordance with the product specifications. The excitation wavelength is 490～500 nm and the emission wavelengthis 515～525 nm.

Appearance
Yellow green solution or lyophilizate

Source of sodium hyaluronate
Streptococcus sp.

CAS number of sodium hyaluronate
9067-32-7

Hyaluronic Acid Oligosaccharides

Intended Use

Useful for the research of various activities which high molecular hyaluronic acid does not have

Background

Hyaluronic acid is a glycosaminoglycan, which does not include sulfate ester function, and was isolated from the vitreous body of cow's eye by Dr. Karl Meyer and his assistant Dr. John Palmer in 1934. Hyaluronic acid is constructed from disaccharide repeating units, each consisting of a D-glucronic acid and N-acetyl-D-glucosamine. The number of disaccharide repeating units are 10,000 or more in hyaluronic acid. Hyaluronic acid existe almost of vertebrate, and distributed in all parts of body, especially distributed in vitreous body, synovial fluid, skin, egg cell, and brain. Biological features of high molecular hyaluronic acid is water-retention, maintenance of cell, and differentiation control.
Recently, low molecular hyaluronic acid and hyaluronan oligosaccharide become known to have various activities which high molecular hyaluronic acid does not have. As shown in the reference, many papers show that changing molecular weight the product exhibits opposite activities. For example, HA6 shows "Induction of NO and MMPs in chondrocytes". PG Research has isolated and purified these hyaluronic acid oligosaccharides (HA Oligosaccharides)as shown below to have endotoxicin-free Oligosaccharides, and has been presenting them for *in vitro* use.

Molecular Weight

820.61

HA Oligosaccharide 4mer: GlcAβ1→3(GlcNAcβ1→4 GlcA)1β1→3GlcNAc

Description	Cat. No.	Quantity
DNP-Ascaris [Form] Lyophilized protein powder / 2,4-dinitrophenylated Ascaris Extract [Volume] Protein: 10 ㎎ / Conjugation ratio: 19.3 DNP groups/molecule (Lot #XXXXXX) (As average of molecular weight: 100,000) [Concentration] Add 1.0 ㎖ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-0009	1 vial
TNP-Ascaris [Form] Lyophilized protein powder / 2,4,6-trinitrophenyl Ascaris Crude Extract [Volume] Protein: 5 ㎎ / Conjugation ratio: 33.7 TNP groups/molecule (Lot #XXXXXX) (As average of molecular weight: 100,000) [Concentration] Add 0.5 ㎖ of distilled water. It will become 5mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-1109	1 vial
Ascaris Extract [Form] Lyophilized protein powder Ascaris Crude Extract This product extracted from Ascaris. Ascaris were homogenized with 10-fold 50 mM Phosphate buffer (pH7.2) in an ice bath, and the homogenate were stirred at 4℃ for 24 hours, and centrifuged at dialyzed 4 times by BBS. [Concentration] Add 1.6 ㎖ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-5009	1 vial
DNP-Mite-Df [Form] Lyophilized protein powder Ascaris Crude Extract / 2,4-dinitrophenylated Mite-Df Crude Extract [Volume] Protein: 5 ㎎ / Conjugation ratio: 4.6 DNP groups/molecule (Lot #XXXXXX) (As average of molecular weight: 50,000) [Concentration] Add 1.7 ㎖ of of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-0533	1 vial
DNP-Mite-Dp [Form] Lyophilized protein powder Ascaris Crude Extract / 2,4-dinitrophenylated Mite-Dp Crude Extract [Volume] Protein: 5 ㎎ / Conjugation ratio: 8.5 DNP groups/molecule (Lot #XXXXXX) (As average of molecular weight: 50,000) [Concentration] Add 1.2 ㎖ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-0544	1 vial
Mite-Df Feces AG (Mite DfF AG) [Form] Lyophilized protein powder / Mite-Df Feces Crude Extract This product extracted from feed and superficial of House Dust Mites, Dermatophagoides farinae (Hughes) Feed and mite body were stirred with PBS, and centrifuged and the supernatant was dialyzed at 4℃ by PBS. [Concentration] Add 3.4 ㎖ of distilled water. It will become PBS (Dulbeco, pH7.4) solution.	LSL-LG-2334	1 vial
Mite Extract-Df [Form] Lyophilized protein powder Mite-Df Crude Extract This product extracted from House Dust Mites, Dermatophagoides farinae (Hughes)*. Mites were homogenized with 10-fold 50 mM Phosphate buffer (pH7.2) in an ice bath, and the homogenate were stirre were stirred at 4℃ for 24 hours, and centrifuged at dialyzed 4 times by BBS. [Concentration] Add 2.5 ㎖ of distilled water. It will become PBS (Dulbeco, pH7.4) solution.	LSL-LG-5339	1 vial
Mite-Dp Feces AG (Mite DpF AG) [Form] Lyophilized protein powder / Mite-Dp Feces Crude Extract This product extracted from feed and superficial of House Dust Mites, Dermatophagoides pteronyssinus (Trouessari) Feed and mite body were stirred with PBS, and centrifuged and the supernatant was dialyzed at 4℃ by PBS. [Concentration] Add 4.2 ㎖ of distilled water. It will become PBS (Dulbeco, pH7.4) solution.	LSL-LG-2444	1 vial
Mite Extract-Dp [Form] Lyophilized protein powder Mite-Dp Crude Extract This product extracted from House Dust Mites, Dermatophagoides pteronyssinus (Trouessari) Mites were homogenized with 10-fold 50 mM Phosphate buffer (pH7.2) in an ice bath, and the homogenate were stirred at 4℃ for 24 hours, and centrifuged at dialyzed 4 times by BBS. [Concentration] Add 2.0 ㎖ of distilled water. It will become 5mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-5449	1 vial
Mite Extract-Tp [Form] Lyophilized protein powder Mite-Tp Crude Extract This product extracted from House Dust Mites, Tyrophagus putrescentiae (Schrank) Mites were homogenized with 10-fold 50 mM Phosphate buffer (pH7.2) in an ice bath, and the homogenate were stirred at 4℃ for 24 hours, and centrifuged at dialyzed 4 times by BBS. [Concentration] Add 3.3 ㎖ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-5559	1 vial

Description	Cat. No.	Quantity
DNP-Cedar Pollen-Cj [Form] Lyophilized protein powder / 2,4-dinitrophenylated Japanese Cedar Pollen-Cj Crude Extract [Volume] Protein: 2 mg / Conjugation ratio: 11.3 DNP groups/molecule (As average of molecular weight: 30,000) [Concentration] Add 3.3 mℓ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-0528	1 vial
Cedar Pollen Extract [Form] Lyophilized protein powder / Cedar Pollen Crude Extract This product extracted from Mountain Cedar, Juniperus asheii Pollen*. [Volume] Protein: 5 mg [Concentration] Add 3.0 mℓ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-5229	1 vial
Cedar Pollen Extract-Cj [Form] Lyophilized protein powder / Cedar Pollen-Cj Crude Extract This product extracted from Japanese cedar, Cryptomeria Japonica Pollen Pollens were stirred with 10-fold 0.125M NaHCO3 (pH8) at 4℃, and homogenized lightly, and centrifuged at dialyzed 4 times by BBS. [Concentration] Add 2.3 mℓ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-5280	1 vial
Hinoki Cypress, Pollen Crude Extract [Form] Lyophilized protein powder / Hinoki Pollen Crude Extract This product extracted from Hinoki Cypress, Chamaecyparis obtusa Pollen Pollens were stirred with 20 volumes of 0.125 M NaHCO3 (pH8) at 4℃ for 16 hours, homogenized, centrifuged, and the supernatant dialyzed against BBS. [Concentration] Add 2.0 mℓ of distilled water. It will become 5mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-5779	1 vial
Ragweed Pollen Extract [Form] Lyophilized protein powder / Ragweed Pollen Crude Extract This product produced from Short Ragweed, Ambrosia artemisiifolia Acetone treated pollen was stirred with 20 volumes of 0.125 M sodium bicarbonate (pH 8) at 4℃ for 16 hours, centrifuged, and the supernatant dialyzed against BBS. [Concentration] Add 1.0 mℓ of distilled water. It will become 5mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-5889	1 vial
DNP-BSA [Form] Lyophilized protein powder / 2,4-dinitrophenylated Bovine Serum Albumin [Volume] Protein: 30 mg / Conjugation ratio: 5.6 DNP groups/molecule (As average of molecular weight: 69,000) [Concentration] Add 1.8 mℓ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution	LSL-LG-0017	1 vial
DNP-BSA (30) [Form] Lyophilized protein powder / 2,4-dinitrophenylated Bovine Serum Albumin [Volume] Protein: 20 mg / Conjugation ratio: 32.7 DNP groups/molecule (As average of molecular weight: 69,000) [Concentration] Add 2.2 mℓ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-3017	1 vial
BPO-BSA [Form] Lyophilized protein powder / Benzylpenicilloyl Bovine Serum Albumin [Volume] Protein: 30 mg / Conjugation ratio: 3.5 BPO groups/molecule (As average of molecular weight: 69,000) [Concentration] Add 1.6 mℓ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-0317	1 vial
BPO-BGG [Form] Lyophilized protein powder / Benzylpenicilloyl Bovine γ-Globulin [Volume] Protein: 20 mg / Conjugation ratio: 5.3 BPO groups/molecule (As average of molecular weight: 170,000) [Concentration] Add 1.0 mℓ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-0577	1 vial
TNP-BSA [Form] Lyophilized protein powder / 2,4,6-trinitrophenyl Bovine Serum Albumin [Volume] Protein: 10 mg / Conjugation ratio: 25.4 TNP groups/molecule (As average of molecular weight: 170,000) [Concentration] Add 0.8 mℓ of distilled water. It will become 5mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-1117	1 vial
DNP-OA (Ovalbumin) [Form] Lyophilized protein powder / 2,4-dinitrophenylated Chicken Egg Albumin [Volume] Protein: 20 mg / Conjugation ratio: 9.6 DNP groups/molecule (As average of molecular weight: 45,000) [Concentration] Add 1.5 mℓ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution	LSL-LG-0024	1 vial

DNP-Casein [Form] Lyophilized protein powder / 2,4-dinitrophenylated Bovine Casei [Volume] Protein: 30 ㎎ / Conjugation ratio: 17.8 DNP groups/molecule (As average of molecular weight: 45,000) [Concentration] Add 1.6 ㎖ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution	LSL-LG-0047	1 vial
DNP-LG (β-Lactoglobulin) [Form] Lyophilized protein powder / 2,4-dinitrophenylated Bovine β-Lactoglobulins A&B [Volume] Protein: 30 ㎎ / Conjugation ratio: 4.9 DNP groups/molecule (As average of molecular weight: 18,400) [Concentration] Add 1.5 ㎖ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-0067	1 vial
DNP-KLH [Form] Lyophilized protein powder / 2,4-dinitrophenylated Hemocyanin, Keyhole Limpet [Volume] Protein: 10 ㎎ / Conjugation ratio: 3.7 DNP groups/molecule (As average of molecular weight: 100,000) [Concentration] Add 1.1 ㎖ of distilled water. It will become 5 mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-0089	1 vial
Wormwood Pollen Extract [Form] Lyophilized protein powder / Wormwood Pollen Extract [Volume] Protein: 5 ㎎ / Conjugation ratio: ratio: 3.7 DNP groups/molecule (As average of molecular weight: 100,000) [Concentration] Add 1.1㎖ of distilled water. It will become 5mM Borate buffered saline [BBS] (pH 8.0), 0.9% NaCl solution.	LSL-LG-5999	1 vial

β-2 GPI (Apolipoprotein H)

Background

β_2-Glycoprotein I (also termed apolipoprotein H) is an inhibitor of the intrinsic blood coagulation pathway, ADP-dependent aggregation, and prothrombinase activity of activated platelets. The protein is also involved in binding of anticardiolipin antibodies to solid phase cardiolipin in ELISA.

Solution

2 ㎎ /0.5 ㎖ , 10mM HEPES, pH7.4, 150 mM NaCl (0.5㎖)

Quality

Purified from normal human sera. The preparation is negative for HBs antigen and HTLV-Ⅲ antibody.

Drosophila Diptericin Inhibitor TPS-17

Intended Use

A unique tool which inhibits the innate immunity of insects

Background

Innate immunity comprises evolutionarily conserved self-defense mechanisms against microbial infections. In mammals, innate immunity interacts with adaptive immunity and has a key role in the regulated immune response. Therefore, innate immunity is a pharmaceutical target for the development of immune regulators. Using Drosophila *ex vivo* culture systems (Yajima *et al*. Biochem. J. 371, 205-210, 2003), a cyclopentanediol analogue is isolated from Aspergillus sp. as an immunosuppressive substance (Sekiya *et al*. Biochem. Pharm. 75, 2165-2174, 2008). This compound selectively suppresses activation of the imd pathway in Drosophila *in vivo* and the target molecules of the compound lie between the Imd adaptor protein and dTAK1 kinase in the imd pathway. In human cells, the compound suppresses TNF-a, but not IL-1β, stimulation-induced activation of NF-kB, suggesting that its target molecules are upstream of TAK1 in mammalian innate immunity. The compounds, TPS-17 and TPS-19, are developed from the cyclopentanediol analogue (Kikuchi *et al*. Eur. J.Med.Chem 46. 1263-1273, 2011).

IL-1Receptor-Ig heterodimer-containing medium for IL-1 inhibition

Intended Use

IL-1 inhibition

Source

Condition medium (RPMI 1640, 10% FBS, 100 unit/mℓ penicillin, 100 μg/mℓ streptomycin) was obtained from Cos-7 cells cotransfected with pCAGGS- Rat GRO/CINC2 alfa N- Human IL-1R acp- Human IgG1Fc- 6His and pCAGGS- Human IL-1R II- Human IgG1 Fc- Rat GRO/CINC2 alfa C- Myc by Fugene 6 (Roche, Indianapolis, IN). It was filtered by Millex-GV Filter Unit, 0.22 μm (Millipore, Billerica, MA). It contains not only human IL-1R-Ig heterodimer but also IL-1R acp- IgG1Fc homodimer and IL-1R II- IgG1Fc homodimer. However, IL-1 inhibition effect by IL-1R-Ig heterodimer is much stronger than that by their homodimers. MOCK medium was obtained from them trasfected with pCAGGS.

Background

Interleukin-l (IL-l α and IL-1 β) is a proinflammatory cytokine involved in immune responses including both innate and acquired immunity. IL-1 is thought to play a role in many diseases, including arthritis, heart disease, pancreatitis, multiple myeloma, and stroke. IL-1 receptor (IL1R) I, also known as CD121a, is an 80 kDa type I transmembrane (TM) protein that binds cytokines IL1 α and IL1 β and transduces a signal. Whereas IL1RII, also known as CD121b, is an 65 kDa protein that binds cytokines IL1 α and IL1 β but does not transduce a signal. Signal transduction requires complex formation with the IL1R accessory protein (IL1R acp), another type I TM protein. Soluble IL1R acp and soluble IL-1RII is present in normal serum and soluble form of the IL-1 receptor accessory protein (acp) increases the affinity of binding of IL-1 α and IL-1 β to the soluble IL1RII

1). Inhibition of IL-1 is beneficial in many animal models of disease and is expected to offer a new therapy for various human diseases.

Koningic Acid

Intended Use

Anticancer agent development of new action mechanism

Background

Koningic acid (CAS No. 57710-57-3) (Figure 1) is a sesquiterpene lactone (molecular mass of 280.3) produced by the fungus Trichoderma koningii. Koningic acid inhibits glyceraldehyde 3-phosphate dehydrogenase (GAPDH) from various species by binding to the essential Cys residue in the catalytic site through a thioether bond. The covalent modification of the essential Cys by koningic acid leads to irreversible inactivation of GAPDH. The affinity of koningic binding to GAPDH for the inactivation is 1.6 μM Koningic acid is effective in inhibiting GAPDH of cells in culture at 10-50 μM. Koningic acid produces glucose-dependent ATP depletion in malignant cells. There are many examples ofthe Application of koningic acid in biochemical and biomedical researches.

Specification

Synonym
Heptelidic acid

Molecular Weight
280.32

Form
100 mM DMSO solution

Appearance
Clear liquid

Purity

Pristane synthetic

Applications

Adjuvant for research of pristane-induced arthritis and antibody production

Background

The isoprenoid alkane Pristane (2,6,10,14-tetramethylp entadecane) has found several important applications in medical research and biotechnology including the induction of autoimmune and arthritis symptoms in rodents, the induction of rodent plasmacytomas with properties similar to those of multiple myeloma patients. It is perhaps most widely used as an adjuvant for preconditioning the peritoneal cavity of mice and rats to increase production of ascites fluid following injection of hybridoma cells for the isolation of monoclonal antibodies.

Until recently, the primary commercial feedstock for the purification of natural pristane has been shark liver oil from the Basking Shark (*Cetorhinus maximus*). Recently the availability of natural pristane has decreased sharply following protection to the Basking Shark and other shark species agreed to by international conventions. Synthetic pristane is therefore growing in importance as a commercial substitute for natural pristane.

AGEs [Advanced Glycation End Products]-BSA

Intended Use

For research of potencial role of AGEs modification in nomal ging as well as age-enhanced disease processes

Background

The products of the nonenzymatic glycation and oxidation of proteins, lipids and nucleic acids, the advanced glycation end-products (AGEs), accumulate in various pathological conditions, such as diabetes, inflammation, renal failure, and aging. AGEs accumulate at site of microvascular injury in diabetes, including the kidney, the retina, and within the vasculature. The enhanced formation of AGEs also exists in various disease, such as atherosclerosis, Alzheimer's disease, end-stage renal disease (ESRD), rheumatoid arthritis and liver cirrhosis. AGEs can arise not only from glucose, but also from dicarbonyl compounds, short chain-reducing sugars and other metabolic pathways of glucose. This was prepared from D-glucose and BSA.

Macrokiller V300

Intended Use

For researching diseases such as allergy, Alzheimer's disease and cancer, by inhibiting macrophage activity.

Background

Macrokiller V300 is liposomes containing clodronic acid, which has the cytocidal effect of macrophages (e.g. osteoclast and microglia). Due to the low cell permeability by itself, clodronic acid was contained into liposome to increase phagocytic efficiency of macrophages. In recent years, there are reports those macrophages play roles in many kind of diseases such as allergy, Alzheimer's disease and cancer, furthermore, in tissue regeneration. Macrokiller V300 will be a useful tool for researching these diseases by inhibiting macrophage activity.

Composition

Hyaluronan Binding Protein

Intended Use

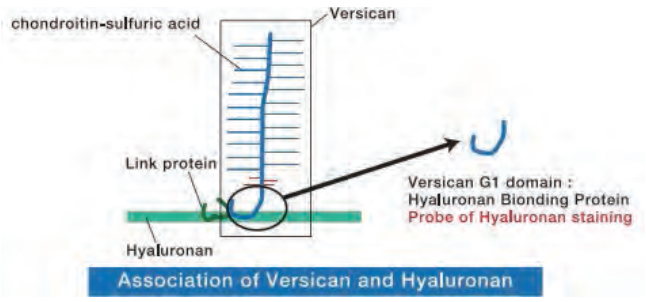
Useful for detection of the hyaluronan (HA)

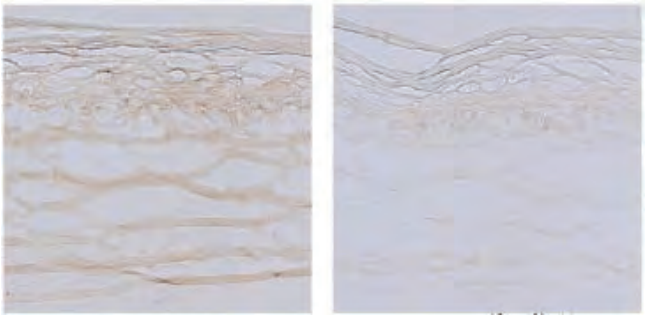
Applications

Immunohistochemistry, ELISA

Background

Hyaluronan binding protein rHABP is produced by expression induced culturing in the presence of IPTG using *E.coli* BL21(DE3)RIL transfected with human versican G1-domain expression vector pRK172VG1. As compared with animal-derived HABP,the high biological safety is confirmed. rHAB doesn't bind to other Glycosaminoglycan and DNA and specifically detects the hyaluronan (HA). Biotin is attached to rHAB to make the biotin-HABP.





Biotin-rHABP 2u/mℓ
Left: No hyaluronidase tratment, Right: Hyaluronidase tratment

Description

Versican G1 domain bind specifically to hyaluronan and doesn't bind to other glycosaminoglycan DNA. Versican G1 domain can be used for hyaluronan detection probe.

Psoralen

Background

As an RNA polymerase tracks along helical DNA during transcription, positive supercoils of DNA are produced in front of the polymerase and negative supercoils are generated behind it. These supercoils are then relaxed by topoisomerases. Matsumoto and Hirose developed a method to visualize the transcription-coupled negative supercoils in an interphase genome. The technique relies on the ability of 4, 5', 8-trimethyl psoralen (abbreviated as psoralen below) to intercalate into DNA. Upon exposure to 365 nm light, the intercalated psoralen crosslinks DNA strands at a rate that depends on the degree of negative superhelicity in the DNA. Using biotinylated psoralen and fluorescent streptavidine, the unconstrained negative supercoils can be visualized within a cell. The psoralen reagent was further improved by replacing a linker region between psoralen and biotin with a delivery peptide derived from HIV Tat protein. This allows rapid incorporation of the reagent into cells without prior treatment with a detergent. The method is applicable to cultured cells, tissue slices and dissected out small tissues where transcription is being carried out.

CellEase®II Series

Intended Use

For DNA extraction

Features

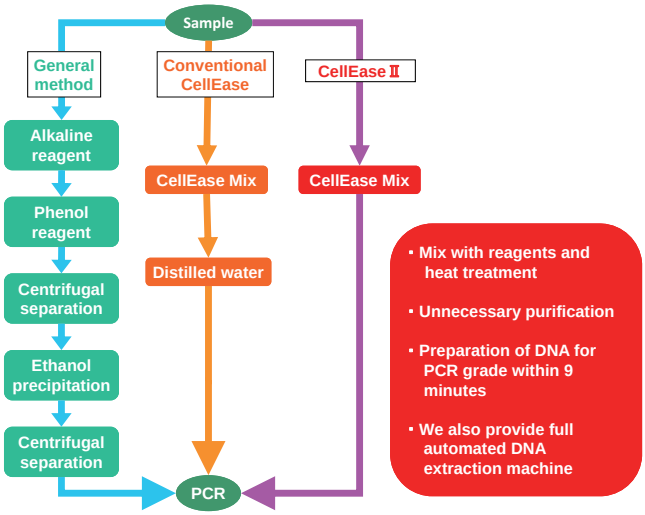
- Process only takes 9 minutes
- Only temperature control is necessary

The original reagents which enables DNA extraction by using heat treatment only.

Only 9 minutes !
Without purification !
Without separation !
Without dillution !
Only temp. control !

Background

This product, developed for DNA extraction from cells, enables easy preparation of DNA samples for PCR without any purification steps only in 9 minutes. Compared to ordinary CellEase®, CellEase®II doesn't require dilution steps and efficiency of extraction has been improved. The method is very simple. Mix the vials of CellEase® A and B to samples and incubate in two temperatures.
DNA samples can be prepared from animal tissue, microorganisms including plant cells. We have several series of kits available for animal cell, microorganisms and processed meat. Low cost and easy DNA extraction kits are provided not only for laboratory use, but also for risk management in contamination control in the food industry.



Application

DNA extraction and detection from mouse tail samples

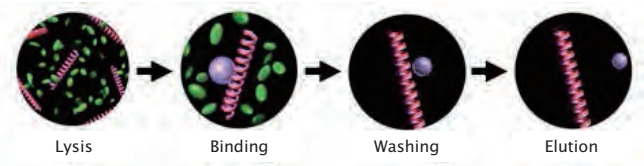
MagExtractor™ -Genome-

Intended Use

For extraction of high purity genomes with magnetic silica beads

Background

This kit is for the extraction of high purity genomic DNA from biological samples such as blood and cultured cells. The recovered genomic DNA can be used in enzymatic reactions such as PCR. Since this kit employs the principle that magnetic silica beads bind genomic DNA present in a lysate solutions, deproteinization using harmful reagents such as phenol, ethanol precipitation, or high-speed centrifugation is not necessary, thus simplifying the extraction process. This kit is suitable for the MFX Series automatic nucleic acids extraction system and can also be used as a manual kit for B/F (solid-liquid) separation using a magnetic beads separation stand. When extracting genomic DNA from blood, whole blood can be used for DNA extraction. Leukocyte separation is not necessary as required by conventional methods.



The selectivity of extracted nucleic acids can be changed by optimization of the binding and washing solutions. MagExtractor™ -Genome- (Cat No. TYB-NPK-101) extracts genomic DNA from various specimens (e.g. whole blood, cultured cells or animal tissues etc.). MagExtractor™ -RNA- (Cat No. TYB-NPK-201) extracts total RNA from various specimens (e.g. cultured cells or animal tissues). MagExtractor™ -Plasmid- (Cat No. TYB-NPK-301) extracts plasmids from *E. coli* cells, MagExtractor™ -Viral RNA- (Cat No.TYB-NPK-401) is a kit for extracting viral RNA from serum or plasma specimens. MagExtractor™ -Plant Genome- (Cat No. TYB-NPK-501) is a kit for extracting genomic DNA from various plant specimens (e.g., leaf, cultured cells, etc.). MagExtractor™ -PCR & Gel Clean up- (Cat No. TYB-NPK-601) extracts DNA fragments from a PCR solution, enzyme solution, or agarose gel slices.

Feature and Advantages

- **Suitable for various kinds of samples**
  Allows the extraction of genomic DNA from samples such as whole blood, cultured animal cells, animal tissue, and mouse-tails.
- **Quick, Simple Extraction**
  Magnetic silica beads bind genomic DNA, allowing quick and simple extraction. Whole blood can be used when extracting genomic DNA from blood.
- **No Phenol or Chloroform Extraction**
  This kit does not require the use of harmful phenol or chloroform. Thus, no hazardous waste is produced.
- **Produces High Purity Genomic DNA**
  Genomic DNA extracted with this kit hardly contains any impurities such as RNA or proteins, allowing direct use in various experiments.

Application

Genomic DNA extraction from whole blood, cultured animal cells, animal tissue, and mouse-tails.
The recovered genomic DNA can be used directly, mainly in PCR or other enzymatic reactions.

1. Examination of Yield and Purity

Genomic DNA was extracted from 100 μℓ of whole blood using this kit and others commercially available. The yield obtained with this kit was approximately equivalent to those obtained with the commercially available ones. With regard to purity, impurities such as proteins or RNA were more likely to have been present with use of the other commercially available kits (companies A and C), whereas such impurities were not detected with the use of this kit. The results show that use of this kit allows extraction of high purity genomic DNA from biological samples such as whole blood.

2. Example PCR Using Extracted DNA

PCR was carried out after extracting genomic DNA from 100 μℓ of whole blood collected from ten healthy, unrelated donors. Using 1/20 of the total amount of the extracted DNA, PCR was performed with Taq DNA polymerase with a single-locus probe of the VNTR regions of DNA, MCT 118, as a target. Approximately 1.4-2.2 μg of high purity genomic DNA with an A260/280 ratio between1.83 and 1.84 was obtained.
MCT118 is a repeated sequence of 16 bases, and by determining the number of these repeats, profiling can be performed. Specific bands for each individual were detected In this PCR with MCT118 as a target.

MagExtractor™ -PCR & Gel Clean up-

Intended Use

For purification of DNA fragments from various solutions and slices of agarose gel

Background

This kit is for purification of high purity DNA from DNA solutions after enzymatic reactions or from agarose gels after electrophoresing. DNA purified with this kit hardly contains any impurities such as proteins or salts, allowing its use in various applications including PCR sequencing, restriction endonuclease digestion and ligation. Since this kit employs the principle that magnetic silica beads bind genomic DNA present in a lysate solution, it is not necessary to perform deproteinization using harmful reagents such as phenol, ethanol precipitation, or high-speed centrifugation. Simple extraction is possible at a low cost. Unlike commercially available spin columns using silica gel or matrix, this kit allows free adjustment of process scales according to sample amounts, providing convenient, economic extraction. This kit can be used in various applications such as removal of primers and dNTPs after PCR reactions, deproteinizing treatments (including BAP control after reactions), dechlorination of DNA samples prior to electroporation and displacement in buffer after enzymatic reactions. With regard to purification of DNA from agarose gels after electrophoresis, this kit uses a stronger chaotropic agent than the NaI generally used to melt agarose, allowing the agarose to melt at room temperature in a short time. This kit is suitable for the MFX Series automatic nucleic acids purification system and can also be used as a manual kit for B/F (solid-liquid) separation using a magnetic beads separation stand.

Features

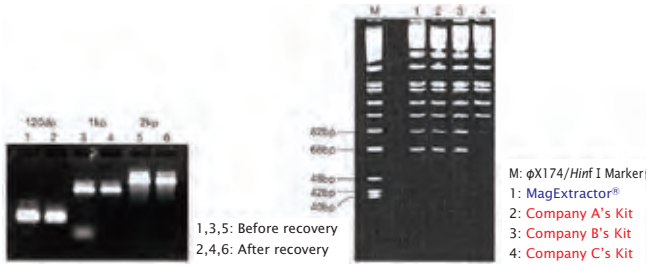
- Extracts DNA fragments from 100 μℓ PCR solutions or enzyme solutions within 5 minutes.
- Extracts DNA fragment from 0.3 g agarose gel slices (TAE or TBE) whithin 15 minutes.
- Agarose slices can be melted at room temperature. Typical yields from solution or gel slices are approximately 60-70%
- DNA fragments of approximately 100 bp to 50 kb can be recovered effectively. Small fragments (< 40 bp) can be removed.
- Purified DNA fragments can be applied to sequencing, restriction enzyme treatment, labelling, ligation, transformation, etc.

Application

Purification of DNA from DNA solutions after enzymatic reactions or agarose gels. Recovered DNA can be used in various applications including sequencing, restriction endonuclease digestion and ligation.

1. Recovery of DNA from Solution

Purification was performed with 100 μℓ of each reaction solution generated from PCR using λ DNA as a template (120 bp, 1 kb and 2 kb) and φX 174/Hinf I Marker (0.25 μg/μℓ), in accordance with the protocol for this kit, for recovery in 100 μℓ of sterile water.
After recovery, the PCR products and the marker were analyzed by agarose gel electrophoresis and acrylamide electrophoresis, respectively.
The results showed that target DNA fragments had a high level of purity, and had primer dimers eliminated in the PCR products (1 kb). Moreover, the limit range of cut off values was estimated at between 40 and 60 bp.



2. Recovery of DNA from the Agarose Gel Block

40 μℓ of each PCR solution (120 bp, 1 kb and 2 kb) and the λ DNA solution (48.5 kb) were electrophoresed using TBE and TAE agarose gels, respectively, and then the target bands were digested and purified for recovery in 40 μℓ of sterile water.
After recovery, DNA was detected by electrophoresis.
It is estimated that the recovery of each PCR product was approximately 70-80% and that of λ DNA at most 60% based on the results of the experiment.
In addition, results show other commercially available kits produced low yield.
In the electrophoretograms, the difference is observed in the mobility of the λ DNA before and after recovery, attributed to the variation in salt concentration of the DNA solution.
The results of other experiments also demonstrated that the recovered DNA can be used in various applications including sequencing, restriction enzyme digestion and ligation.

MagExtractor™ -PCR & Gel Clean up-	TYB-NPK-601	200 rxn

MagExtractor™ -Plant Genome-

Intended Use

For purification of genomic DNA from plant specimen

Background

MagExtractor™ -Plant Genome- provides a simple and reliable method for the rapid purification of genomic DNA from various plant specimens (e.g. leaf and cultured cells) using magnetic silica beads. This kit is based on binding properties of DNA to a silica surface in the presence of chaotropic agents (1). Purified genomic DNA can be used directly for PCR experiments.

Features

- Purified genomic DNA can be used directly for PCR.
- The pretreatment step of this kit is effective in removing polysaccharides.
- This kit is suitable for the high-throughput extraction of genomic DNA from various plant specimens. The following tables show typical sample amounts, yields, and applications for purified genomic DNA.

Composition

Lysis Solution	40 mℓ
Binding Solution	90 mℓ
Washing Solution	200 mℓ
Magnetic Beads	6 mℓ

MagExtractor™ -Plant Genome-	TYB-NPK-501	100 rxn

MagExtractor™ -Plasmid-

Intended Use

For plasmid extraction with magnetic silica beads

Background

This kit is for extraction of high purity plasmid DNA from bacteria such as *E.coli*. The recovered plasmid DNA can be used directly in enzymatic reactions including restriction endonuclease digestion, PCR sequencing and transformation. Magnetic silica beads bind plasmid DNA present in a lysate solution. Deproteinization using harmful reagents such as phenol, or ethanol precipitation is not necessary. Furthermore, high-speed centrifugation is minimized, and is not necessary if the MFX Series automatic nucleic acids extraction system is used. This kit is suitable for the MFX series automatic nucleic acids extraction system and can also be used as a manual kit for B/F (solid-liquid) separation using a magnetic beads separation stand.

Features

- Typical plasmid yield from an *E. coli* cell line carrying a high-copy plasmid is approx. 3-6 μg.
- This kit is suitable for high throughput extraction of plasmid from *E. coli* cells. The extraction time is 10-15 minutes.
- Purified plasmid can be applied directly to sequencing, enzyme reaction, transformation, etc.
- This kit does not contain hazardous substances, such as phenol or chloroform.

MagExtractor™ -Plasmid-	TYB-NPK-301 TYB-NPK-391	500 rxn 500 rxn

MagExtractor™ -RNA-

Intended Use

For extraction of high purity RNA from cells, tissues, and yeast samples using magnetic silica beads

Background

This kit extracts of high purity total RNA from biological samples such as cultured cells and tissues. The recovered total RNA can be used mainly in enzymatic reactions such as RT-PCR. Since this kit employs the principle that magnetic silica beads bind total RNA present in a lysate solution, it is not necessary to perform deproteinization using harmful reagents such as phenol, ethanol precipitation, or high-speed centrifugation like the conventional AGPC method. This kit is suitable for the MFX Series automatic nucleic acids extraction system and can also be used as a manual kit for B/F (solid-liquid) separation using a magnetic beads separation stand.

Features

Suitable for Various Samples
Allows extraction of total RNA from cultured cells, tissues, and yeast, etc. Total RNA mainly contains rRNA and mRNA.

Quick, Simple Extraction
MagExtractor™ -RNA- is based on the principle that magnetic silica beads bind total RNA, enabling quick simple extraction.

No Phenol or Chloroform Extraction
This kit does not require the use of harmful phenol or chloroform for deproteinization so there is no hazardous waste problem.

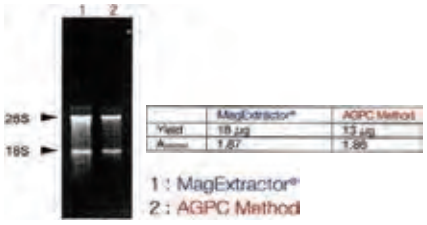
Produces High Purity Total RNA
The total RNA extracted withthis kit rarely contains impurities such as DNA or proteins, allowing for use in enzymatic reactions such as RT-PCR.

Application

Extraction of Total RNA from Cultured Cells, Tissue, and Yeast, etc. The recovered total RNA can be used in enzymatic reactions such as RT-PCR.

1. Examination of Yield and Purity

Total RNA was extracted from 2×10^6 HeLa cells using this kit and the widely used AGPC RNA extraction method. The yield obtained with this kit was approximately equivalent to that obtained by AGPC method. With regard to purity, the electrophoretic patterns and OD ratios indicate that this kit extracts high purity RNA with almost no contamination by impurities such as proteins and DNA.



2. Example PCR with Extracted RNA

1 μg of the total RNA extracted from 2×10^6 HeLa cells was used to perform RT-PCR with transferrin receptor mRNA as a target (2115 bp). As a result, amplification of the target was detected onlyin the reverse transcription reactions, and expression of the normally low-volume expression transferrin receptor gene was confirmed. The result showed that using RNA obtained with various targets.

MagExtractor™ -Viral RNA-

Intended Use

For Purification of viral RNA from serum or plasma specimens.

Background

MagExtractor™ -Viral RNA- provides a simple and reliable method for the rapid purification of viral RNA from serum or plasma specimens using magnetic silica beads. This kit is based on the principle that RNA can be absorbed onto a silica surface in the presence of chaotropic agents (1), (2) and an RNA-binding accelerator. The purified viral RNA can be used directly for RT-PCR experiments.

Features

- This kit is suitable for the high-throughput extraction of viral RNA from serum or plasma specimen using magnetic silica beads.
- This kit does not contain hazardous substances such as phenol or chloroform.
- No ethanol is used in the washing steps.

Magical Trapper	TYB-MGS-101	1 set

GoldMAN

Intended Use

For transfection of adenovirus

Background

GoldMAN is a gold/iron-oxide composite nanoparticles as a new type of magnetic beads for in-vitro and in-vivo applications. Au particles with sizes of less than 10 nm are homogeneously immobilized on the surface of support magnetic nanopaticles. As the gold part can be used as a general tag for various functional molecules, the composite nanoparticles can be easily functionalized for each application. We are developing magnetic beads for separation/purification of biomolecules, immunodiagnosis, gene transfection reagents, and MRI contrast agents. The dispersibility and magnetic property of the magnetic beads are optimized for each application. For example, it can be applied for transfection of adenovirus.

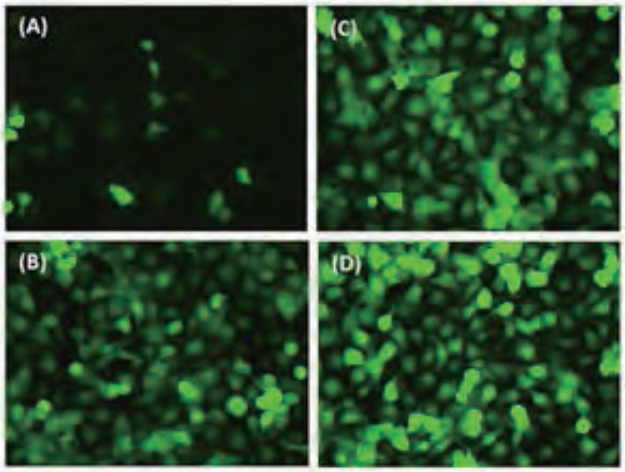

Figure 1 Gene transduction of the Ad/GoldMAN complex into B16BL6 CAR (-) cells.
Efficient gene transfer by Ad/GoldMAN complex was assessed by 1.0×10^8 vp of Ad-EGFP. Gene expression of EGFP in B16BL6 cells was observed under fluorescence microscopy. (A) Transfection using Ad-EGFP/GoldMAN complex without magnetic force. (B)-(D) Transfection using Ad-EGFP/GoldMAN complex under magnetic force for (B) 15 min, (C) 30 min, (D) 60 min.

KOD -Plus- Mutagenesis Kit

Intended Use

For various mutations, such as substitutions, insertions, and deletion mutations.

Background

This kit is an inverse PCR (iPCR)-based site-directed mutagenesis kit using KOD DNA polymerase as a high-fidelity PCR enzyme. This reagent was developed based on a high fidelity and efficient PCR reagent, KOD-Plus- (Code No. KOD-201), which consists of KOD DNA polymerase and anti-KOD DNA polymerase antibodies for Hot Start PCR.
This kit enables not only the introduction of point mutations, but also the introduction of large insertions and deletions. The PCR fidelity of KOD-Plus- is greater than Taq DNA polymerase (ca. 80-fold); therefore, unexpected, 2nd-site mutations can be reduced. PCR reactions can be performed using standard PCR primers and do not require phosphorylated primers, because this protocol contains a Phosphorylation Step of PCR products.

Features

- High efficiency (95% maximum) can be obtained.
- Simple protocol facilitates speedy experiments.
- Phosphorylated primers are not required.

Application

*Site-directed mutagenesis
Substitution (e.g. Point mutation, Point mutation library)
Deletion (e.g. 1 bp several kbp deletion)
Insertion (e.g. Introduction of His-tag sequence)

Composition

The KOD -Plus- Mutagenesis Kit contains enough reagents for 20 mutagenesis reactions, including 5 control reactions.

KOD-Plus-(1 U/ μℓ)	25 μℓ
10x Buffer for iPCR	125 μℓ
2 mM dNTPs	125 μℓ
DpnI (10 U/ μℓ)	50 μℓ
T4 Polynucleotide Kinase (5 U/ μℓ)	50 μℓ
Ligation high (T4 Ligase + Buffer Mixture)	250 μℓ
Control Plasmid pAK119M (50 ng/μℓ)	10 μℓ
Control Primer #1 (10 pmol/ μℓ)	10 μℓ
Control Primer #2 (10 pmol / μℓ)	10 μℓ

Principle

A) Inverse PCR of plasmid DNA, using a mutation primer.

B) Plasmid DNA is digested by Dpn I.
Note: Dpn I digests methylated DNA, such as plasmid DNA from typical *E. coli* cell lines (e.g. JM109 and DH5 α).

C) Self-ligation of PCR products is performed by a reaction with T4 polynucleotide kinase and ligase.

D) Transformation of *E. coli* cell lines using self-ligated PCR products.

LipoTrust™

Intended Use

For gene / nucleic acid transfection

Background

This is cationic liposome which consists of three highly effective transfection formulations strictly selected from more than three hundreds. What makes them unique is that no conversion to serum-free medium is required at the transfection. And they show high gene expression activity both *in vitro* and *in vivo*.

LipoTrust™ SR : shows high gene expression activity to many kinds of cells in the presence of serum

LipoTrust™ PE : shows constant gene expression activity in the presence or absence of serum

LipoTrust™ CH : shows remarkably high gene expression activity in the serum-free medium, and is available for transfection into non-adherent type cells.

As most transfection reagents have little gene expression activity in serum-containing medium, use of serum-free medium is recommended. LipoTrust™ has enough gene expression activity in serum-containing medium as well, so that it can be used in both type of experiments with or without serum either *in vitro* or *in vivo*.
Though general transfection reagents are known to be cytotoxic, LipoTrust™ causes much less cytotoxicity. Moreover, the product form, lyophilizate, makes it possible to choose from two types depend on your purpose. Oneis Coating Type, which is to be used by dissolving the empty LipoTrust™ with nucleic acid solution to reconstruct liposomal membrane without compromising effective nucleic acid retention. The other Lipoplex Type is the general type which is used by mixing the transfection reagent solution with nucleic acid solution.

These pictures show change of liposome form when they are disposed in the medium containing 5% FBS. The nanoparticle structures disappeared in the medium with 15min in the case of other product, while spherical forms are still retained after one hour with LipoTrust™ SR.

LipoTrust™ EX Gene

Intended Use

Transfection reagent for plasmid DNA

Background

LipoTrust™ EX Gene Reagent is a proprietary cationic liposome formulation that facilitates highly efficient delivery of Plasmid DNA to mammalian cells.

Feature and Advantages

- Excellent transfection efficiency with minimizing cytotoxicity.
- Transfection is available in the presence of serum.
- Medium replacement after transfection is not necessary.

LipoTrust™ Oligo for *in vitro* and *in vivo*

Intended Use

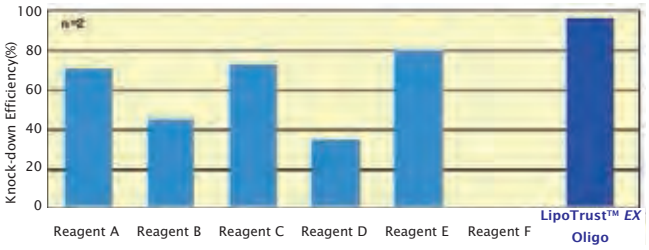
Transfection reagent for short oligonucleotides (e.g. siRNA, antisense DNA, miRNA etc.)

Background

They are proprietary cationic liposome formulation that facilitates highly efficient delivery of short oligonucleotides such as siRNA, antisense DNA or miRNA to mammalian cells.

Feature and Advantages

- Higher knock-down efficiency is expected with low concentration of short oligonucleotide.
- Transfection is available in the presence of serum.
- Higher level transfection would be expected *in vivo* use with minimizing cytotoxicity.



This graph shows knock-down efficiency in the experiment of 40nM anti-Luciferase siRNA transfection into HeLa cell which carries Luciferase genes. The height of bars shows knock-down efficiency, and 100% means that Luciferase activities are completely knocked down to zero. Loading quantity of each transfection reagent is according to respective protocols.

SAFETRANS (α-CDE)

Intended Use

Superior nucleic acids carrier without severe cytotoxicity *in vitro* and *in vivo*

Background

Gene and oligonucleotide therapies are emerging as a potential strategy for the treatment of genetic diseases, cancers, cardiovascular diseases and infectious diseases. Recently, polyamidoamine (PAMAM) dendrimer (generation (G) 3) conjugate with α-cyclodextrin (α-CDE) has been known as novel DNA, shRNA and siRNA carriers. α-CDE works as a superior nucleic acids carrier without severe cytotoxicity *in vitro* and *in vivo*.

Application

pDNA, shRNA, siRNA, shRNA, miRNA Transfection
Reverse Transfection

Cells with compatibility

A549
NIH3T3

SAFETRANS (α-CDE)	CSR-KMU-T01	2 mg

SAFETRANS (GUG-β-CDE)

Intended Use

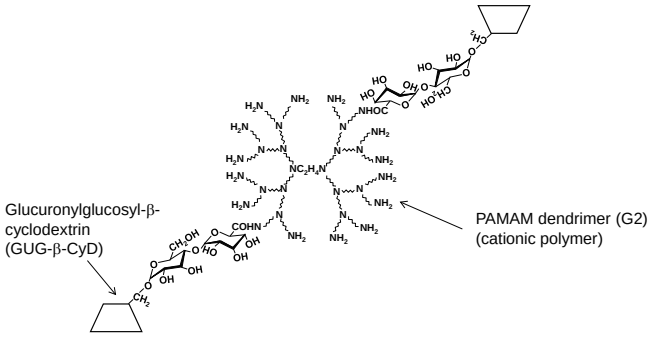
Superior nucleic acids carrier without severe cytotoxicity *in vitro* and *in vivo*

Background

The polyamidoamine (PAMAM) starburst dendrimer (generation 2, G2) conjugates with 6-O-α-(4-O-α-D-glucuronyl)-D-glucosyl-β-cyclodextrin (GUG-β-CDE (G2)) having glucose as a spacer between dendrimer and cyclodextrin(CyD) was newly prepared as a novel gene transfer carrier. GUG-β-CDE (G2) was found to have lower hemolytic activity than dendrimer (G2), suggesting that GUG-β-CDE (G2) had lower local irritation than dendrimer (G2). In sharp contrast to linear polyethyleneimine (10 kDa, PEI), GUG-β-CDE (G2, DS 1.8) had negligible cytotoxicity. GUG-β-CDE works as a superior nucleic acids carrier without severe cytotoxicity *in vitro* and *in vivo*.

Application

pDNA, shRNA, siRNA, shRNA, miRNA Transfection



SAFETRANCE (GUG-β-CDE)

Description	Cat. No.	Quantity

SAFETRANS (Lac-α-CDE)

Intended Use

pDNA and siRNA transfection

Background

It is well-known that asialoglycoprotein receptor (ASGPR) is highly expresses on the hepatocyte cell surface. Recently, lactosylated polyamidoamine (PAMAM) dendrimer (generation (G) 2) conjugate with a-cyclodextrin (Lac-α-CDE) has been known as hepatocyte-selective DNA and siRNA carriers through ASGPR-mediated endocytosis with negligible cytotoxicity *in vitro* and *in vivo*.

Application

pDNA, siRNA Transfection

Description	Cat. No.	Quantity
SAFETRANS (Lac-α-CDE)	CSR-KMU-T03	2 mg

Ab-Carrier™- Antibody Transfection Reagent

Intended Use

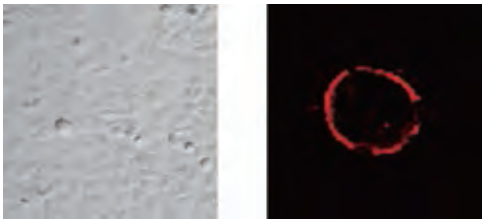
To deliver antibodies into living cells.

Background

It can easily introduce antibodies into living cells efficiently by using the function of an artificial cell penetrating peptide, there by controlling cytotoxicity.

Features

- Suitable for use with 10% serum-containing media.
- Ready-to-use. Easy and quick procedure.
- Very low cytotoxicity.
- Suitable for various antibodies (polyclonal, monoclonal)
- Suitable for transfection of fluorescent-labeled or enzyme-conjugated antibodies.

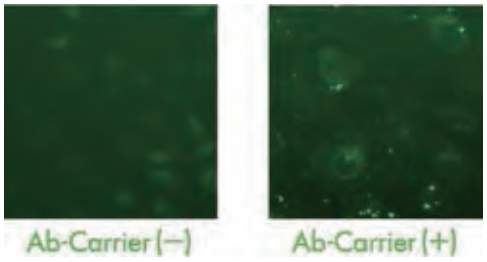


Two hours after introduction to HeLa cell, fix a cell , and observes the fluorescence of anti NPC antibody (mouse IgG1) by cofocus laser microscope after processing with 594 Alexa marks anti mouse IgG antibody.

Specificity

- Endotoxin level < 0.05 EU / μℓ
- Antibody transfection activity (relative value)* 80 - 150 %

* β -galactosidase-conjugated goat IgG was transfected to HeLa cells and incubated for 4 hrs. Antibody transfection activity was estimated by β- galactosidase activity in lysates of the cells. The values represent relative activity (%) to that of Lot N12J15 as standard.



Mix with GFP with an anti GFP antibody (rabbit IgG). Add Ab-Carrier in reaction liquid after a one hour reaction at room temperature. React at room temperature for 20 minutes. Add reaction liquid in a cell. After incubation under 37℃, 5% CO2 existence for four hours, it is observed the fluorescence by cofocus laser microscope.

Description	Composition	Cat. No.	Quantity

Ab-Carrier™	Ab-Carrier 12.5 μℓ×4 Solution : PBS	PTN-P-101-100	100 test

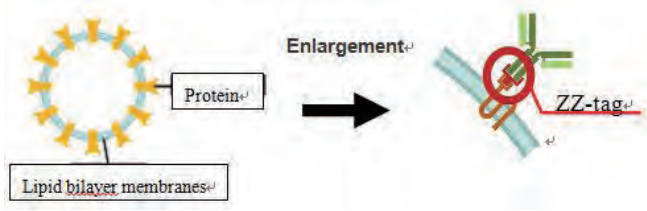
Bionanocapsule-ZZ(BNC-ZZ)

Intended Use

For cell specific transfection of DNA, and detection probe for antigen-antibody complex

Background

The BNC-ZZ is a type of bionanocapsule (hepatitis B virus surface antigen expressing hollow nano-particle) that can easily bind with desired antibodies by simple mixing, and developed for the purposes that 1) recognition and delivery of desired cells using the specificity of antibody against cell surface antigen such as receptors, and 2) easy-to-use detection tool of antigen-antibody complexes.
Basic type of BNC (BNC-L) is composed of L-protein of hepatitis B virus surface antigen which is floating on the particle made from lipid bi-layer. The BNC itself has ability to deliver its content into cytoplasm. Among three regions of L-protein, BNC-ZZ expresses zz-tag amino acids sequence in Pre-S1 region, the outmost region. Because zz-tag binds Fc region of antibodies, BNC-ZZ can binds to antibodies without affecting the antigen recognition site.
Thus, BNC-ZZ can be used for, depending on the antibody used, cell-specific DNA delivery *in vitro*, detection of antigen-antibody complex by using pre-labeled BNC-ZZ, and other applications.



Application

- Cell specific transfection for DNA and others
- Detection probe for antigen-antibody complex. For example, as a replacement of the secondary antibody in various systems, such as western blotting and ELISA.

AteloGene® Local & Systemic Use

Intended Use

To deliver siRNA into animal tissues by local or systemic administration in mice and then efficiently introducing it into cells

Background

RNA interference (RNAi) is a mechanism where fragments of double-strand ribonucleic acid (dsRNA) interfere with the expression of a specific gene whose sequence is complementary to the dsRNA. Recently, RNAi medicines, which inhibit the expression of genes responsible for diseases, have been studied activitely. However, the delivery of siRNA *in vivo* has become a big issue as siRNA is unstable *in vivo*. AteloGene® consists of a system mediated by atelocollagen, a solubilized collagen obtained by protease treatment. Atelogene transfects siRNA *in vivo* efficiently and safety in either local or systemic administration.

Atelocollagen, the main component of AteloGene®, forms siRNA/miRNA-atelocollagen complexes by mixing with appropriate quantity and ratio of synthetic siRNA/miRNA. Because siRNA-atelocollagen complexes repress the degradation of nucleic acid, it is optimal for *in vivo* transfection, and siRNA/miRNA is effectively delivered and introduced into the cells.

AteloGene® Local Use is designed for localized administration because of its gelation capability. Gelated siRNA/miRNA-atelocollagen complexes remain at the injection site and siRNA/miRNA is delivered into the cells effectively.

AteloGene® Systemic Use is suitable for systemic administration via tail vein injection because it does not gelate, and siRNA/miRNA is delivered effectively via the bloodstream throughout the whole body.

Feature and Advantages

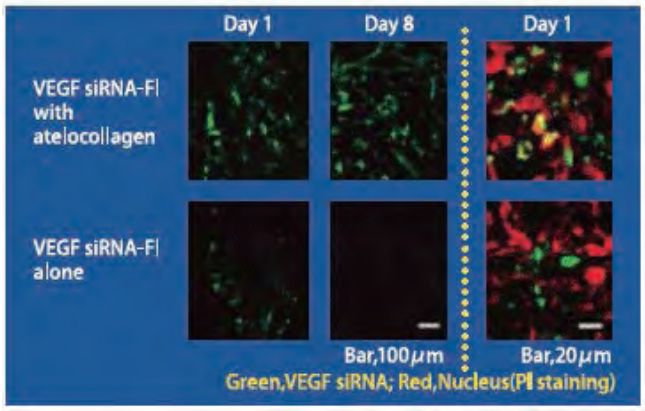
- Immediate administration to experimental animals by simple mixing the synthetic siRNA with AteloGene®
- Efficient *in vivo* transfection of siRNA.
- Effect of RNAi of preventing degradation by RNase persists for a long time.
- AteloGene® has no toxicity, and its main component, atelocollagen, demonstrates high biological compatibility.

Principle

When mixed with synthetic siRNA at an appropriate concentration and ratio, atelocollagen, which is a major component of AteloGene® forms a complex appropriate for administration into the body. siRNA that is prepared into a complex with atelocollagen is efficiently delivered *in vivo* and introduced into the cells

Stabilization of siRNA *in vivo* by AteloGene®

AteloGene® injection has little effect on background gene expression.
Inhibition of tumor proliferation by administration of VEGF siRNA



AteloGene® Local Use formula was mixed with fluorescent labeled vascular endothelial growth factor (VEGF) siRNA and injected into a subcutaneous tumor. Compared to VEGF siRNA alone, siRNA complexed with AteloGene® was delivered to tumor cells effectively and siRNA was still detected after 8 days. Remarkable inhibition of tumor proliferation was also confirmed.

AteloGene® injection has little effect on background gene expression.

Comparison of hepatotoxicity from microarray results

Up-regulated gene ontology category	P-Value < 0.0001	
	AteloGene	Liposome
0009607: response to biotic stimulus	P>0.05	2.37×10^{-6}
0006952: defense response	P>0.05	1.09×10^{-6}
0006955: immune response	0.0375	9.84×10^{-5}
0009613: response to pest, pathogen or parasite	P>0.05	1.15×10^{-2}
0043207: response to external biotic stimulus	P>0.05	6.45×10^{-2}
0009615: response to virus	P>0.05	1.25×10^{-1}
0009605: response to external stimulus	P>0.05	1.71×10^{-1}

0006950: response to stress	P>0.05	6.17×10^{-1}
0006954: inflammatory response	P>0.05	2.30×10^{-1}
0006953: acute-phase response	P>0.05	1.07×10^{-1}
0045087: innate immune response	P>0.05	7.55×10^{-1}
0006917: induction of apoptosis	P>0.05	9.98×10^{-1}
0012502: induction of programmed cell death	P>0.05	9.98×10^{-1}
0043068: positive regulation of programmed cell death	P>0.05	8.33×10^{-1}

The effects of AteloGene® Systemic Use injection versus liposome injection on mouse liver-cell gene expression was compared by microarray analysis. Expression levels of genes from several ontological categories, including apoptosis-related genes, were upregulated strongly by liposome injection where as AteloGene® injection showed hardly any effect.

Composition

This kit is intended for 10 times of administration.

- Prefilled syringe (filled with "AteloGene®")
  Each syringe is for 5 times of administration - 600 μℓ ×2 syringes
- 10×siRNA buffer - 3mℓ×1 bottle
- Sterilized water 3mℓ×1 bottle
- Microtube - 2 mℓ×2 tubes
- Disposable syringe - 1 mℓ × 2 syringes
- 18G needle (for ejection and suction) - 4 needles
- 26G needle (for injection) - 2 needles
- Instruction manual - 1 leaflet

GenomONE™- CF EX SeV-E (HVJ-E) 1 vial Cell Fusion Reagents

Intended Use

For hybridoma preparation and other cell fusion procedures

Background

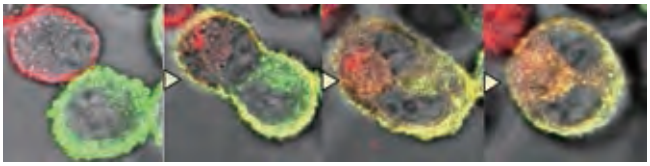
GenomONE™-CF EX is a cell fusion kit comprised of Sendai virus envelope (SeV-E, HVJ Envelope, HVJ-E) and special buffers. It can be used with both adhering cells and suspension cells. Fusion of the same or different cell types can be completed in only 30 minutes.

Feature and Advantages

GenomONE™ - CF EX produces more antibody secreting hybridomas than PEG. (following cell fusion, cells were grown in media containing hybridoma growth supplement as indicated).
Normal BALB/c mouse splenocytes (1×10^8 cells) not sensitized with antigen were fused to X63-Ag8.653 myeloma cells (1×10^7 cells) using GenomONE™-CF EX or PEG1500. The fused cells obtained with each agent were inoculated onto five 96-well plates (Day 0). Beginning the following day, half of the culture medium (10%FBS/RPMI1640) was replaced with HAT medium at five points of time (Days 1, 2, 3, 5, and 8), and the growth of colonies in each well was assessed on Days 10 -11 to determine the hybridoma-positive rate (an indicator of efficiency of fusion). On Day 12, mouse antibody level (IgG + IgA + IgM) in the supernatant was measured by ELISA, to calculate the antibody production-positive rate. The effect of adding a commercially available hybridoma supplement to the medium after fusion was also assessed (supplement was also added to the HAT medium).

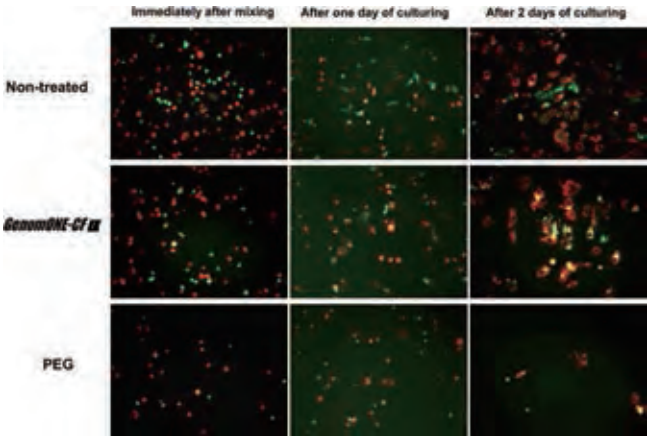
Application

1. Hybridoma preparation
   Cell fusion involving PEG and electrofusion
   Preparation of monoclonal antibodies
   Fusion of antigen-sensitized B cells and myeloma cells
2. Fusion of suspension cells
3. Fusion of adherent cell and suspension cell
4. Application in premature chromosome condensation (PCC)
   Detection of chromosomal damage and repair by fusion of different types of cells in different cell phases
5. Research on regenerative medicine and cytotherapy
   Fusion of somatic cells and stem cells, etc.
6. Research on embryonic development/differentiation
   Nuclear transfer (nuclear replacement)

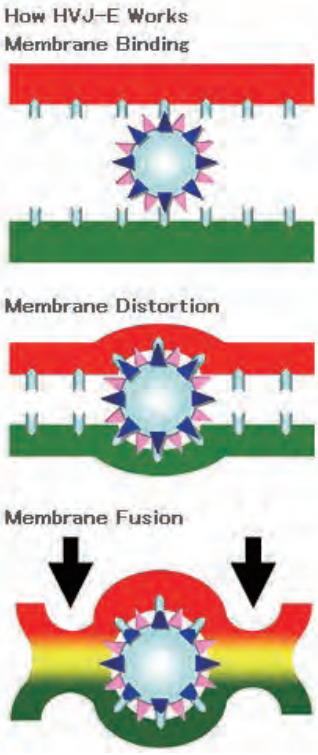


BHK-21 cells labeled with red and green fluorescent dyes incubated at 37℃ in the presence of HVJ-E and observed under a confocal laser scanning microscope.

Comparison with PEG method in the fusion of different types of cell



Rat MSC cells (rat bone marrow-derived mesenchymal stem cells) labeled with red fluorescence*1 were combined with rat primary cardiac myocytes labeled with green fluorescence*2 (each 2×10^5 cells) in 50 μℓ of a buffer for cell fusion. The mixture was incubated on ice for 5 minutes and then at 37℃ for 15 minutes. As a result, fused cells (yellow) were formed (GenomONE-CF suspension method). Fused cells adhering to the plate were also observed after 1-2 days of culturing. In the PEG-treated group, high cytotoxicity appeared immediately after cell fusion, reducing the number of fused cells obtained.



If HVJ-E is added in amounts of more than several hundred HVJ-E per cell at low temperatures (0-8℃), HVJ-E is immediately adsorbed on the cell surface mediated by the receptor (acetyl type sialic acid recognized by HN protein) (Membrane Binding), and cells undergo agglutination cross-linked by HVJ-E particles (Membrane Distortion). At this stage, the hydrophobic domain at the N-terminal of cleaved F protein (F1) penetrates into the double lipid layer of the cell membrane, causing distortion of the membrane severe enough to allow an inflow of ions.

If this cell/HVJ-E complex is heated at 37℃, the distortion of the cell membrane is further expanded, accompanied by temporary alteration of the cell membrane lining structure. This change is transient and the membrane soon returns to its normal structure. However, if a strong hydrophobic connective force is applied at this stage, fusion between cell membranes takes place (Membrane Fusion).

Description	Composition	Cat. No.	Quantity
GenomONE™- CF EX SeV-E (HVJ-E) 1 vial Cell Fusion Reagents	• Freeze-dried Sendai virus envelope (HVJ-E) - 1Vial (Approx. 0.26mℓ) • HVJ-E suspending buffer - 1Vial (0.5mℓ) • Cell fusion buffer (20×concentrate) - 1Vial (10mℓ) • Instruction Manual - 1leaflet	ISK-CF-001-EX	1 set

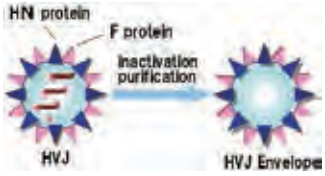
GenomONE™- Neo EX HVJ-E Transfection Reagents

Intended Use

GenomONE™ -Neo EX is a non-viral reagent for transfection. Unique, efficient transfection of siRNA, DNA oligonucleotides, proteins. Low toxicity with primary cells. Protocols for *in vivo* transfection.

Background

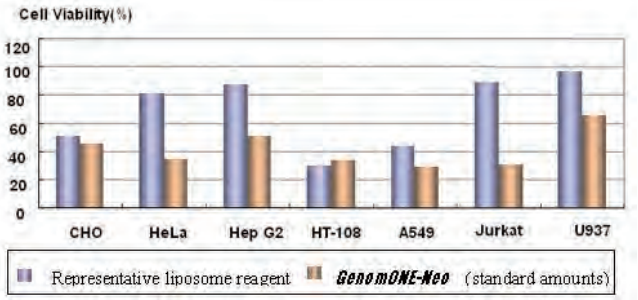
HVJ (hemagglutinating virus of Japan) Envelope VECTOR KIT is a tool for transfection of molecules (plasmid DNAs, siRNAs, oligonucleotides, proteins, antibodies etc.) into cells and animal tissue by means of membrane fusion. The HVJ envelope, carrying the molecule to be transfected, is composed of a completely inactivated and purified HVJ (Sendai virus) while preserving the cell membrane-fusing capability of the envelope.
GenomONE provides ready-to-use kits containing the HVJ envelope and auxiliary reagents (incorporation enhancer, incorporation reagent, introduction enhancer, buffer).



Principle

What is HVJ Envelope (HVJ-E)?

HVJ Envelope is a purified product prepared through complete inactivation of Sendai virus (HVJ*). It is a vesicle in which only the cell membrane-fusing capability of the envelope protein of Sendai virus is retained.
It is known that the HN protein in the tunica externa of the Sendai virus recognizes the receptor (possessing sialic acid atthe terminal of sugar chain) on the cell membrane and adsorbs it, leading to the induction of membrane fusion mediated by F protein (another component of the envelope). The genomic RNA of the Sendai virus contained in HVJ-E has been inactivated completely and has neither infective nor proliferative potentials in humans or experimental animals. HVJ-E can be used safely at ordinary laboratories, without requiring any special operations or facilities.
*HVJ: Hemagglutinating Virus of Japan.
Conventional non-viral transfection tools, including cationic lipids, are incorporated into cells through endocytosis which results in degradation of the transferred DNA by lysosomes. On the other hand, HVJ Envelope VECTOR resists degradation by lysosomes, making it easy to transfer the specified DNA. Therefore, HVJ Envelope VECTOR yields highly efficient gene expression. Sialic acid receptors, which are needed to trigger binding with HN protein, exist in almost all animal cells. Thus, HVJ Envelope VECTOR is useful for a wide range of targets.



Feature and Advantages

1. Wide usability GenomONE™ HVJ Envelope VECTOR KIT is a highly flexible tool for transfecting a wide variety of molecules (plasmid DNAs, siRNAs, oligonucleotides, proteins, antibodies etc.) into cultured cells (adherent and non-adherent) and tissue. GenomONE is useful for transfecting sensitive primary cells and is further distinguished by its ability to deliver contents into live animals. Many literature citations are available for each GenomONE-Neo application.
2. Safety Unlike cationic lipids, GenomONE-Neo delivers the molecule of interest into cells via membrane fusion, not by endocytosis where cargo may be degraded by lysosomal enzymes. Since GenomeONE™-Neo is a purified HVJ (Sendai virus) product, prepared from virus particles completely inactivated for infectious ability and proliferative potential it is completely safe to use without special precautions.
3. GenomONE™ provides ready-to-use kits containing the HVJ envelope and required auxiliary reagents (incorporation enhancer, incorporation reagent, introduction enhancer, and buffer). Suggested protocols for all major applications are included.

Application

1. siRNA transfection

***in vivo*:**
Primary T cell (Human peripheral blood)
Primary cardiac myocyte (Rat cardiac myocyte)
Differentiated C2C12 (Mouse myoblast)
monkey ES cells
Min6 (Mouse pancreatic β cell)
U937 (Human myelomonocytic cell)
***in vivo*:**
Intradermally transplanted human cervix cancer /HeLa (SCID mouse)
Submandibular gland (rat)

2. Protein delivery

***in vitro*:**
Primary macrophage (C3H mouse peritoneal resident)
Swiss 3T3 cell (Mouse embryonic fibroblasts)
***in vivo*:**
Nucleus tractus solitarius (Rat brain)

3. Oligo DNA transfection

***in vitro*:**
Primary HDMECs (Human dermal microvascular endothelial cell)
Primary CD34+ cell (Human blood)
***in vivo*:**
Uterus (Mouse)
Skin, ear lobe (Mouse)
Lung (Mouse)

4. Plasmid DNA transfection

***in vivo*:**
Uterus(Mouse)
Palatal periodontal tissue (Rat)
Myocardium (Rat heart)
Lung (neonatal porcine)
Subcutaneously transplanted human colon cancer /LoVo (nude mouse)

GenomONE™- Neo EX HVJ-E 4 vials Transfection Reagents	Freeze-dried HVJ-E (inactivated HVJ) - 4 vials (0.26 mℓ /via) Reagent A (enhancer for incorporation) - 1 vial (0.5 mℓ/vial) Reagent B (reagent for incorporation) - 1 vial (0.3 mℓ/vial) Reagent C (enhancer for introduction) - 1 vial (1.0 mℓ/vial) Buffer (for suspension and dilution) - 1 vial (6.5 mℓ/vial)	ISK-GN-004-EX	1 set

GenomONE™- CAb EX Antibody Delivery Reagents

Intended Use

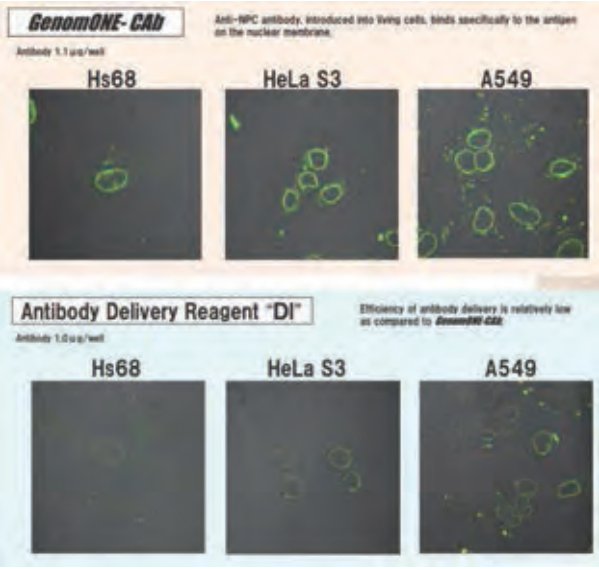
A tool for efficient introduction of IgG antibodies into living cells using HVJ-E envelope (HVJ-E) vector for the purpose of analysis of the functions of cells and intracellular proteins.

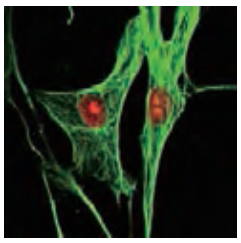
Background

Because antibodies cannot enter cells, past experiments using antibodies focused primarily on extracellular molecules. If target molecules in living cells can be exposed to antibodies, it will be possible to pursue new dimensions of research related to cell function analysis, exploration of target molecules for disease diagnosis and treatment, and so on. GenomONE™-CAb Antibody Delivery Reagent is a next-generation tool for antibody introduction into cells which can meet such needs.With this kit, antibody can be incorporated into the HVJ Envelope (HVJ-E), a transfection tool making use of the membrane fusing ability of inactivated Sendai virus (HVJ: Hemagglutinating Virus of Japan). If cells are treated with HVJ-E including antibody, it will be possible to achieve efficient introduction of IgG antibodies into the cytoplasm. This kit provides a totally new methodology for experiments, overcoming the difficulties involved in experiments using conventional lipid-based reagents by which antibodies are introduced into cells by means of endocytosis.

Principle

With this system, the IgG antibody incorporation enhancer, which was developed by our company, improves the efficiency of inclusion of IgG molecules into HVJ-E markedly compared to the existing HVJ-E vectors (GenomONE™, GenomONE™-Neo) marketed in 2002. Thanks to this feature, this system allows efficient introduction of IgG molecules into the cytoplasm.





Specific binding to tubulin filaments is visible
Nucleus of each cell was stained with SYTO 82 (red)

Features

Analysis of intracellular function

- An antibody is introduced into living cells to examine the distribution of the target molecule within them
- An antibody is introduced into living cells to suppress and clarify the function of target molecules
- Live cell imaging is performed

Screening of antibodies reacting to intracellular antigens

- Antibodies binding to intact antigens in living cells and showing neutralization activity are screened for

Application to testing, diagnosis, and treatment

- New agents for testing and diagnosis are developed using antibodies capable of detecting target molecules in living cells
- Next-generation antibody-based drugs are created, which exert therapeutic effects through acting on intracellular target molecules

Advantages of intracellular antibody introduction (differences from existing knockout method)

- Unlike post-transcriptional gene silencing (RNAi method, etc.), this method is expected to achieve specific inhibition by recognizing protein-protein interactions or post-translational modifications (addition of sugar chains, etc.)
- Nonspecific reactions (off-target effects of RNAi method, etc.) are unlikely to occur
- Unlike gene transfer and expression methods, introduction of antibody in amounts sufficient to exert efficacy can be achieved rapidly and simply, and this method is applicable to a wider range of types of experiments

Advantages

- The presence of 1% BSA, 0.1% gelatin or 0.1% NaN3 (sodium azide) does not affect the efficiency of antibody incorporation into HVJ-E
- Serum in culture medium does not affect the efficiency of antibody introduction into cells

accura-expRACE KIT

Intended Use

Next-generation RACE

Background

- In RACE (Rapid Amplification of cDNA Ends) by the single-primer method* of this kit, the targeted cDNA is amplified by PCR with only a gene-specific primer using ds cDNA as a template.
- The mechanism is based on that the terminal region of the ds cDNA is partially denatured at 68℃ for the extension reaction and that the linear DNA molecule tends to circularize.
- Upon reaching the 5' end of the template DNA, thermostable DNA polymerase switches templates to the 5' terminal region of the newly synthesized daughter strand at a certain probability and synthesizes DNA sequences complementary to the gene-specific primer.
- Using this daughter strand as a template, the targeted cDNA is amplified with only a gene-specific primer.

Feature and Advantages

- By using the accura-expRACE KIT, both 5' and 3' RACE can easily and efficiently be performed under simple conditions, such as RT-PCR.
- Long cDNA and rare cDNA unidentified previously can be isolated.
- The synthesized ds cDNA can be used as a cDNA library. You can perform ~400 screenings of a cDNA library by RACE.
- The cDNA synthesized by this kit contains a high proportion of full-length cDNA because an "advanced type M-MLV Reverse Transcriptase" is used.

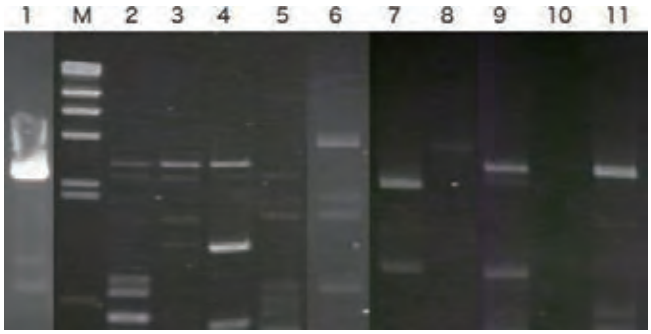

Figure 3. Results of 5' RACE and RT-PCR.
Lane 1: RT-PCR. Lane M: HindIII-digested λ DNA. Lanes 2～11: 5' RACE PCR. Lanes 2～5: Results of a single RACE experiment. Lane 6: Extension time set to 8 min; cDNA was diluted 10-fold. Lanes 7, 8: Extension time set to 4 min; cDNA was diluted 2- and 5-fold, respectively. Lane 9: Same conditions as above. Lanes 10, 11: Extension time set to 4 min; cDNA was diluted 2-fold.

Dermatitic mouse tissue 1st strand cDNA (NC/NgaSlc, 11-week-old)

Description	Cat. No.	Quantity
Dermatitic mouse (11-weel-old NC/NgaSlc) 1st strand cDNA Skin	CSR-MDD-01	15 rxn
Dermatitic mouse (11-weel-old NC/NgaSlc) 1st strand cDNA Spleen	CSR-MDD-02	15 rxn
Dermatitic mouse (11-weel-old NC/NgaSlc) 1st strand cDNA Thymus	CSR-MDD-03	15 rxn
SPF mouse (11-weel-old NC/NgaSlc) 1st strand cDNA Skin	CSR-MDD-01C	15 rxn
SPF mouse (11-weel-old NC/NgaSlc) 1st strand cDNA Spleen	CSR-MDD-02C	15 rxn
SPF mouse (11-weel-old NC/NgaSlc) 1st strand cDNA Thymus	CSR-MDD-03C	15 rxn

CIA (Collagen Induced Arthritis) mouse tissue 1st strand cDNA (DBA/1JJmsSlc, 13-week-old)

Description	Cat. No.	Quantity
CIA mouse (13-week-old DBA/1JmsSlc) 1st strand cDNA Ankle joint	CSR-MDA-01	15 rxn
CIA mouse (13-week-old DBA/1JmsSlc) 1st strand cDNA Spleen	CSR-MDA-02	15 rxn
CIA mouse (13-week-old DBA/1JmsSlc) 1st strand cDNA Thymus	CSR-MDA-03	15 rxn

Normal mouse tissue 1st strand cDNA (DBA/1JJmsSlc, 13-week-old)

Description	Cat. No.	Quantity
Control mouse (13-week-old DBA/1JmsSlc) 1st strand cDNA Ankle joint	CSR-MDA-01C	15 rxn
Control mouse (13-week-old DBA/1JmsSlc) 1st strand cDNA Spleen	CSR-MDA-02C	15 rxn
Control mouse (13-week-old DBA/1JmsSlc) 1st strand cDNA Thymus	CSR-MDA-03C	15 rxn

Normal mouse tissue 1st strand cDNA (ICR, 7-10-week-old)

Description	Cat. No.	Quantity
Mouse Pancreas First Strand cDNA	PMC-MPCDNA-COS	50 µℓ
Mouse Pancreas First Strand cDNA (dT)	PMC-MPCDNA-DT-COS	50 µℓ

Normal rat tissue 1st strand cDNA (Wistar/Crlj:WI, 8-week-old)

Description	Cat. No.	Quantity
Rat (8-week-old Wistar (Crlj:WI)) 1st strand cDNA Brain	CSR-RD-01	15 rxn
Rat (8-week-old Wistar (Crlj:WI)) 1st strand cDNA Heart	CSR-RD-02	15 rxn

cDNA Libraries

Description	Immunogen	Cat. No.	Quantity
cDNA Library, Human ; 293T [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 2.2×10^6 2) Average insert size : longer than 1 kb	Human	BAM-02-729-EX	500 ng
cDNA Library, Human contact inhibition state [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 50×10^6 2) Average insert size : longer than 1 kb	Human	BAM-02-727-EX	500 ng
cDNA Library, Human ; Fibroblast Primary culture [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 8.6×10^6 2) Average insert size : longer than 1 kb	Human	BAM-02-725-EX	500 ng
cDNA Library, Human ; HeLa (#1) [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 5.6×10^6 2) Average insert size : longer than 1 kb	Human	BAM-02-723-EX	500 ng
cDNA Library, Human ; Umbilical Vein Endothelial Cells [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 1.8×10^6 2) Average insert size : longer than 1 kb	Human	BAM-02-721-EX	500 ng
cDNA Library, Mouse ; Testis [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: $6\times10_6$ 2) Average insert size : longer than 1 kb	Mouse	BAM-02-715-EX	500 ng
cDNA Library, Mouse ; Thymocyte [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 5.6×10^6 2) Average insert size : longer than 1 kb	Mouse	BAM-02-713-EX	500 ng
cDNA Library, Planaria ; Planaria [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 14×10^6 2) Average insert size : longer than 1 kb	–	BAM-02-709-EX	500 ng
cDNA Library, Rat NRK Cell Log Phase [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 1.4×10^6 2) Average insert size : longer than 1 kb	Rat	BAM-02-719-EX	500 ng
cDNA Library, Rat ; Rat embryonic fibroblast [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 62×10^6 2) Average insert size : longer than 1 kb	Rat	BAM-02-717-EX	500 ng
cDNA Library, S.cerevisiae Log Phase [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 3.6×10^6 2) Average insert size : longer than 1 kb	*Saccharomyces cerevisiae*	BAM-02-701-EX	500 ng
cDNA Library, S.pombe ; After + HU, γ , MMS h-L972 [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 7.7×10^6 2) Average insert size: longer than 1 kb	*Schizosaccharomyces pombe*	BAM-02-707-EX	500 ng
cDNA Library, S.pombe ; Meiosis [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 1.3×10^6 2) Average insert size: longer than 1 kb	*Schizosaccharomyces pombe*	BAM-02-705-EX	500 ng
cDNA Library, S.pombe ; mitosis [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 28×10^6 2) Average insert size: longer than 1 kb	*Schizosaccharomyces pombe*	BAM-02-703-EX	500 ng
cDNA Library, Xenopus ; oocyte [Size] 500 ng (40 ng/μℓ , 13μℓ) in 10 mM Tris-HCl-1mM EDTA (pH 7.5) [Quality] 1) Number of independent clones: 1.1×10^6 2) Average insert size : longer than 1 kb	–	BAM-02-711-EX	500 ng

Protein

Description	Cat. No.	Quantity
single-stranded DNA binding protein (SSB)	BAM-02-042-EX BAM-02-042-5EX	200 μg 5×200 μg
T4 gene 32 protein (Single-stranded DNA binding protein, SSB)	BAM-02-040-EX BAM-02-040-5EX	200 μg 5×200 μg
Taq RecA protein	BAM-02-048-EX	100 μg
Taq single-stranded DNA binding protein (SSB)	BAM-02-044-EX	100 μg

THUNDERBIRD® Series

Intended Use

For real time PCR

Background

THUNDERBIRD® qPCR Mix is a highly effective master mix (2×concentration) for realtime PCR which has been developed with Taq DNA polymerase as a base.
THUNDERBIRD®Probe qPCR Mix is a highly efficient 2x Master Mix for real-time PCR using TaqMan® probes. The master mix contains all required components, except for ROX reference dye, probe and primers (50x ROX reference dye is individually supplied with this kit). The master mix facilitates reaction setup, and improves the reproducibility of experiments. This product is an improved version of Realtime PCR Master Mix (Code No. TYB-QPK-101). In particular, reaction specificity and PCR efficiency is enhanced.

Features

- **High specificity**
  The specificity for the detection of low-copy targets is improved.
- **Homogeneous amplification**
  The dispersion of PCR efficiency between targets is reduced by a new PCR enhancer*. (*Patent pending)
- **Broad dynamic range**
  High specificity and effective amplification enable the detection of a broad dynamic range.
- **Compatibility for various real-time cyclers.**
  The reagent is applicable to most real-time cyclers (i.e. Block type and glass capillary type). Because the 50x ROX reference dye is individually supplied with this kit, the kit can be applied to real-time cyclers that require a passive reference dye.
- **Hot start PCR**
  The master mix contains anti-Taq DNA polymerase antibodies for hot start technology.
  The antibodies are easily inactivated in the first denaturation step, thereby activating the DNA polymerase.

Description	Cat. No.	Quantity
THUNDERBIRD® Probe qPCR Mix 【Composition】 THUNDERBIRD® Probe qPCR Mix, 50×ROX reference dye	TYB-QPS-101T TYB-QPS-101 TYB-QPS-101X5	1×1 mℓ 3×1.67 mℓ 1 set
THUNDERBIRD® SYBR® qPCR Mix 【Composition】 THUNDERBIRD® SYBR® qPCR Mix, 50×ROX reference dye	TYB-QPS-201T TYB-QPS-201 TYB-QPS-201X5	1×1 mℓ 3×1.67 mℓ 1 set

SYBR® Green Realtime PCR Master Mix Series

Intended Use

- Quantitative Determination of Gene Expression by Two-Step RT-PCR
- SNP Typing

Features

- This reagent can be used in glass capillary systems (e.g., LightCycler, Roche Molecular Systems, Inc.).
- This reagent can be used in a passive reference system (e.g., ABI PRISM® 7700, Applied Biosystems, Inc.). The passive reference dye does not affect any other systems.
- Hot Start technology with anti-Taq DNA polymerase antibodies enables high specificity and reproducible amplification

Background

This product is a Taq DNA polymerase-based 2×master mix for real-time PCR, which contains all components, except for the primer. This reagent is applicable for intercalation assay with SYBR® Green I.

Description	Cat. No.	Quantity
SYBR® Green Realtime PCR Master Mix	TYB-QPK-201 TYB-QPK-201X5	5×1 mℓ 25×1 mℓ
SYBR® Green Realtime PCR Master Mix -Plus-	TYB-QPK-212 TYB-QPK-212X5	5×1 mℓ 5×5×1 mℓ

Protein Engineering

Remarkable Yield Translation System

Intended Use

E.coli Cell-free Protein Synthesis System

Background

The Remarkable Yield Translation System (RYTS) Kit is a cell-free protein synthesis system. This kit includes an *E.coli* extract and all essential components for coupled transcription/translation reaction. The RYTS Kit contains the *E.coli* Lysate, which is prepared according to a unique method developed for highly efficient production of extensive protein by RIKEN.
RYTS Linear Template Set is a reagent to create a template for protein expression. By using this set, you are able to create an expression template with a His-tag on either the N or C termini.

Features

- Highly efficient, convenient and fast
- Maximum yield of protein can reach 150 μg per 300 μℓ reaction
- Clover Direct™ allows incorporation of unnatural amino acids at defined positions of proteins using *in vitro* translation

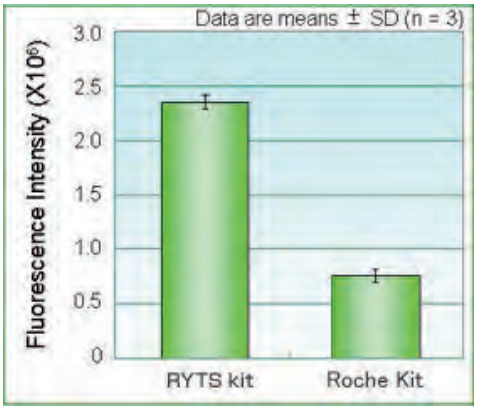
Construction and preparation of expression template

DNA template

The DNA template (circular DNA or linear DNA) for protein synthesis should be contained such that the protein-coding sequence be under the control of a T7 promoter and located downstream of a ribosomal binding site (RBS) sequence. Additionally, the T7 terminator sequence is located downstream of the coding sequence. The distance between the T7 promoter and start ATG should not exceed 100 base pairs, and the distance between the RBS sequence and start ATG should not be more than 5-8 base pairs.

mRNA template

Messenger RNA, which is generally synthesized from a circular or linear DNA template using a commercial transcription kit or RNA polymerase, is also available for the RYTS reaction. In such case, the DNA template for transcription of mRNA should also be constructed according to section 5.1 of the product manual DNA template. However, the T7 promoter, which is recognized by T7 RNA polymerase, can be replaced by other promoters recognized by other RNA polymerase (e.g., SP6 promoter recognized by SP6 RNA polymerase).



Comparison of produced GFP activity

Expression of site-directly labeled proteins
A typical result of the protein labeling using RYTS and CloverDirect TAMRA (Product Code, #PRX-CLD02 and #PRX-CLD06) is shown. In-gel detection of produced TAMRA labeled proteins
2UAG: UAG codon is inserted after initiator AUG codon
ProX tag*: ProX tag is fused to the N-terminus
Applied volume: 0.25 μℓ of RYTS translational reaction mix
White arrow: TAMRA labeled proteins

Example of a template
In case of very low protein yield, optimization of nucleotide sequence (codon usage, addition of N-terminal tags, etc.) is required to improve protein productivity. We recommend the use of ProX tag, which is original N-terminal peptide tag developed for efficient expression in *E.coli* cell-free protein synthesis system.

PUREfrex® & PUREfrex®SS

Intended Use

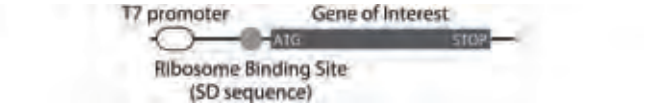
For preparation of prokaryotic proteins, eukaryotic proteins, membrane proteins, and unnatural amino acids. For basic research in protein science, translation, folding of proteins after synthesis. For *in vitro* display, ribosome display, and mRNA display.

Background

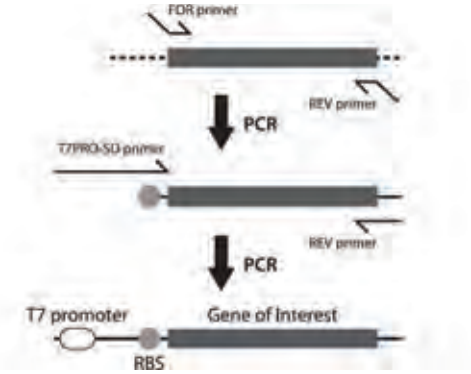
PURE*frex*®

PURE*frex*® kit is a reagent based on the original concept of PURE system technology, which is a "reaction system consisting of translation system only." So, one of the big improvements of PURE*frex*® kit is improved purity of components of the kit. Especially, lipopolysaccharide (LPS) is reduced less than 0.1 EU per 1 μℓ of reaction mixture of PURE*frex*®. Contamination of RNase and β-galactosidase are also reduced.

PCR products, circular DNA, and linear DNA are available as the template DNA for PURE*frex*®. The template DNA must contain a T7 promoter and ribosome binding site (SD sequence) upstream of the gene of interest. The gene of interest must contain an ATG initiation codon and a stop codon. All stop codons, amber, ocher and opal, are available. More than 10 nucleotides are necessary following the stop codon.



To generate template DNA using circular DNA, T7 terminator is necessarily following the gene of interest. To generate template DNA using linear DNA, including PCR product and digested circular DNA by restriction enzyme, T7 terminator is not necessary in the downstream of the stop codon. To generate template DNA using PCR product, overlap extension PCR can be used by steps shown in figure below.



PURE*frex*®SS

PURE*frex*®SS is a newly developed reconstituted cell-free protein synthesis reagent based on PURE system technology. PURE*frex*®SS includes oxidized glutathione (GSSG; Solution IV) and DsbC protein (disulfide bond isomerase; Solution V) as a supplement with PURE*frex*® (GFK-PF001-EX). PURE*frex*® SS enables proteins including disulfide bonds (SS-bond) to be synthesized in active form.

For some proteins, such as secretory proteins to the extracellular, formation of disulfide bond is important for folding and stability. Disulfide bonds are usually formed from the oxidation of sulfhydryl (SH-) groups of adjacent cysteine residues. So, oxidized environment is necessary to form disulfide bonds. Additionally, disulfide bond isomerase which can catalyze the disulfide bridge exchange is also necessary to form a correct paring of cysteines. Using PURE*frex*®SS, the protein can be synthesized under oxidized environment with isomerase.

LINEAR NF-κB Decoy Oligonucleotides Kits and RIBBON NF-κB Decoy Oligonucleotides Kits

Intended Use

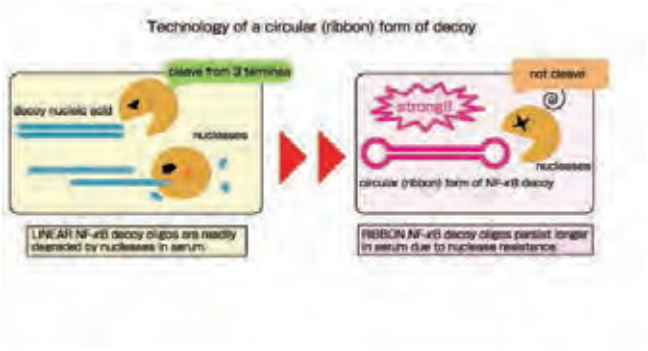
NF-κB decoy oligodeoxynucleotides

Background

Painful inflammatory diseases such as rheumatoid arthritis and atopic dermatitis are currently treated primarily symptomatically, through the use of analgesics. There is a great need for novel therapeutics targeting the underlying inflammatory mechanisms. NF-κB is an intensively studied transcription factor well known for its role in stimulating the production of inflammatory cytokines. Recently, NF-κB decoy nucleic acids have gained considerable attention as potential therapeutics for inflammatory disease due to their ability to inhibit NF-κB-mediated production of inflammatory cytokines, by preventing NF-κB from binding to its native DNA binding sites. Preliminary studies with NF-κB decoys indicate efficacy in reducing both pain and itch. First generation NF-κB decoy nucleic acid drugs were linear DNA duplexes. Such drugs suffered not only from poor cellular uptake, but also from serum half-life due to poor resistance to nucleases. Subsequently, a circular (ribbon) form of NF-κB decoy was developed with improved nuclease resistance and significantly longer half-life.

Composition

Each kit contains the specified oligo and a control oligo with an identical base composition but different sequence that does not bind NF-κB. Phosphorotioate-modified kits are also offered. All oligos are purified by HPLC.



Description	Cat. No.	Quantity
RIBBON NFκB Decoy Oligonucleotides Kit	GDS-DN-25101 GDS-DN-25102	2×0.5 mg 2×0.5 mg

Tol1-based transgenesis vector

Intended Use

Donor and helper plasmids for transgenesis in vertebrates.

Background

The donor plasmid contains terminal regions of the Tol1 element and multicloning sites for integration of a gene to be transferred to the host chromosome. The helper plasmid carries the transposase gene of the Tol1 element. Tol1 is a DNA transposon identified in the medaka fish and demonstrated to be active in various vertebrate species.

Protocol

Recovering plasmid DNA

1. Cut out one of the circles of the paper and immerse it in water or TE in a microfuge tube. Other circles are for backup.
2. Mix by tapping.
3. Centrifuge for 1 minute at >10 krpm.
4. Transform competent bacterial cells (commonly used strains, such as JM109, DH5a and XL1-Blue) with a small amount of supernatant.
5. Spread the bacteria on an LB/agar plate containingl ampicillin, and incubate the plate at 37 oC for >12 hours.
6. Pick up a single colony.
7. Amplify bacteria in liquid media.
8. Extract plsmid DNA by the standard method.

Composition

pDon122: A vacant donor plasmid.
pDon123: Donor plasmid carrying the GFP gene.
pHel105: Helper plasmid. Its vector portion is pCS2+, having the CMV promoter for *in vivo* expression of the transposase gene and the SP6 promoter for *in vitro* synthesis of the transposase mRNA.
pHel106: A defective helper which is useful for negative control experiments especially when you want to know the net transformation efficiency.

CloverDirect™ Series

Intended Use

Pin-point Protein Labeling. An amber stop codon (UAG) used for pin-point fluorescence or biotin labeling.

Background

CloverDirect™ tRNA Reagents for Site-Directed Protein Functionalization allow the incorporation of unnatural amino acids at defined positions of proteins using *in vitro* translation. Unnatural amino acids containing fluorescent groups, biotin, PEG, photo-crosslink are available. Proteins with unnatural amino acids will be obtained within a few hours by adding CloverDirect™ reagents and a DNA template having an amber stop codon (UAG) or a four-base codon (CGGG) to an *in vitro* translation system. CloverDirect™ covers the following four applications. In addition, we provide custom services for the expression of proteins with unnatural amino acids.

Site-Directed Fluorescence Labeling

It is not easy to incorporate fluorescent groups into proteins in a site-direct and quantitative fashion by chemical modification. Various fluorescent dyes are available including those for 488 nm, 543 nm and 633 nm excitation.

Site-Directed Biotin Labeling

Labeling proteins are available for the oriented immobilization onto avidin-coated plates and beads. The biotinylated amino acids have one or two aminohexyl liners between amino acid and biotin.

Site-Directed Post-Translational Modification

It is not easy to prepare post-translationally modified proteins (phosphorylation, methylation, etc). CloverDirect™ tRNA Reagents for Site-Directed Post-Translational Modification allow the incorporation of modified amino acids into proteins to obtain post-translationally modified proteins in a site-direct and quantitative fashion.

Site-Directed Unnatural Mutagenesis

By incorporation of unnatural amino acids containing functional groups, novel functional proteins can be designed and synthesized. CloverDirect™ tRNA Reagents for Site-Directed Unnatural Mutagenesis allow the incorporation of unnatural amino acids with PEG, photo-crosslinking, and photo-isomerizable groups.

Composition

- Unnatural aminoacyl-tRNA×1
- tRNA dissolving buffer×1

Note : One tube contains unnatural aminoacyl-tRNA sufficient for 300 μℓ of *in vitro* translation reaction. Once thawed, unnatural aminoacyl-tRNA can be stored at -70℃ for 2 months.

POLARIC™ PLT-500c6

Intended Use

Solvatochromic Fluorophore for living cells

Background

POLARIC is fluorescence Solvatochromic Dye and changes the fluorescence wavelength according to polarity (hydrophobicity/hydrophilicity) of solvent. The fluorescent wavelength of POLARIC™ changes widely with about 520-700 nm in the exciting light of about 500 nm.

Features and Advantages

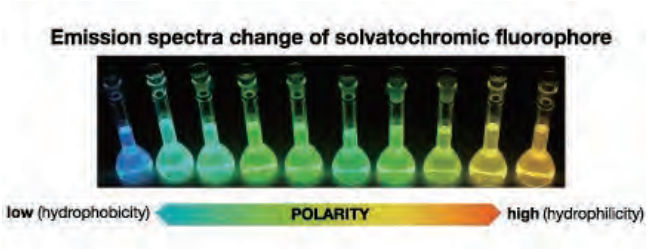
- Extremely low cytotoxicity
- Minimum cell damage by excitation wavelengths around 460 - 520 nm.
- Fade-resistant fluorescence
- Dramatically changes the emission spectra depending on hydrophobicity/hydrophilicity of the microenvironment of cell organelles

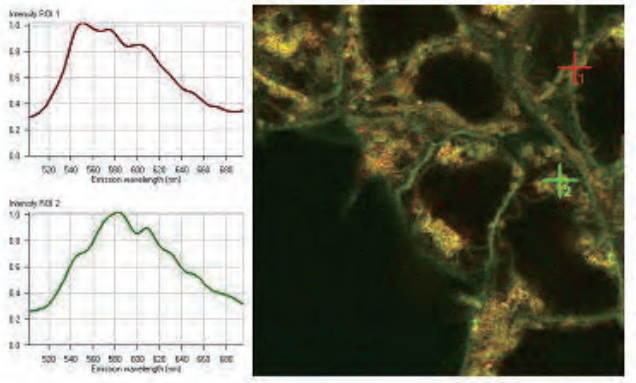
Protocol

1. Dissolve the red dye pellet with 3 μℓ of ethanol, and transfer dye solution into 10 mℓ of medium (staining solution). Staining solution could stored at 4℃ for 2 weeks, protection from light.
2. Culture the cells onto glass bottom dish (nonluminecent glass).
3. Remove the culture medium from the culture dish, rinse with PBS and add the same volume of prewarmed staining solution.
4. Incubate the cells under 5% CO_2, at 37℃ condition for 10 min - 2 hrs. Staining condition should be optimized for your cell.
5. Wash the cell culture 3 times with culture medium after staining process.
6. View the stained cells using a fluorescence microscope atEx 460 nm - 520 nm and Em 520 nm - 700 nm .

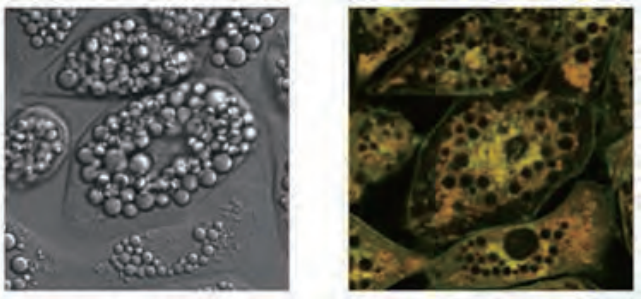
Composition

10 μg /tube× 5 tubes (for 50 mℓ Staining Solution)
*For staining 96-wells plates×5
*Only for ethanol resolution

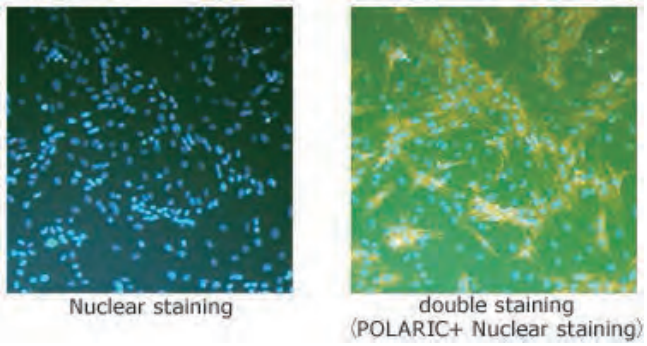




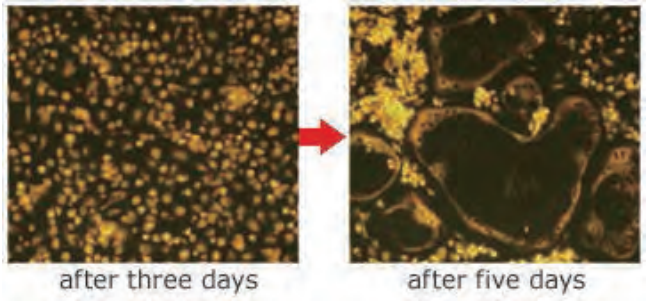
Usage example < HEK293 >
"coloration change" depend on organelle



Usage Example < rVAC (Rat Visceral Adipocyte) >
Mitochondria : orange
Cell membrane : green
endoplasmic reticulum : yellow



Usage Example < Rat Cardiac Muscle Cell >
Staining the cardiomyocyte (orange) and non-cardiomyocyte in different colors is possible. After staining, the cardiomyocyte keeps beating.



Usage Example < Rat Marrow Monocyte >
In culturing with the osteoclast differentiation medium of rat marrow monocyte, the differentiation of rat marrow monocyte into osteoclast was observed while stained.

STELLA+ Lysine Labeling Kit

Intended Use

The STELLA+ Lysine Labeling Kit is for selectively labeling lysine residue of protein (antibody), and localized lysine and/or other amino groups on cell surfaces. Unlike the conventional labeling method with use of succinimidyl ester compound (NHS method), this kit is capable of rapid and efficient labeling at low concentrations by a newly developed ultra-high speed 6 π-Azaelectrocyclization process of hexatriene-β-carbonyl compound. Moreover, since it reacts only with the lysine residue on the protein surface and does not react with N-terminus amino group or lysine residue group, which is indispensable for interaction of receptors, it can perform labeling efficiently without inactivating the function of biomolecules or cells.

Features and Advantages

- This kit is capable of rapid and efficient labeling by 6 pi-electrocyclization reaction process of hexatriene-β-carbonyl compound.
- This kit reacts only with the lysine residue on the protein surface and the bondIs covalent bond.
- Since it does not react with N-end amino group or lysine residue group, which is indispensable for interaction of receptors, the function of biomolecules is not lost.
- In the sample of very low concentration, it can perform labeling efficiently.

When the concentration of the reagent is used by about ten times, the concentration of the labeling sample can be decreased to 10^{-8} M or less level.

Composition

- Lysine labeling unit - 3 pieces
- IBX- polystyrene - 3 pieces
- Filtration tube (0.45 m) - 3 pieces (Uses by 12,000 G or less.)
- Filtration tube (Molecular weight cut off 10,000) - 3 pieces (Uses by 14,000 G or less.)

GlyScope ABEE Labeling Kit

Intended Use

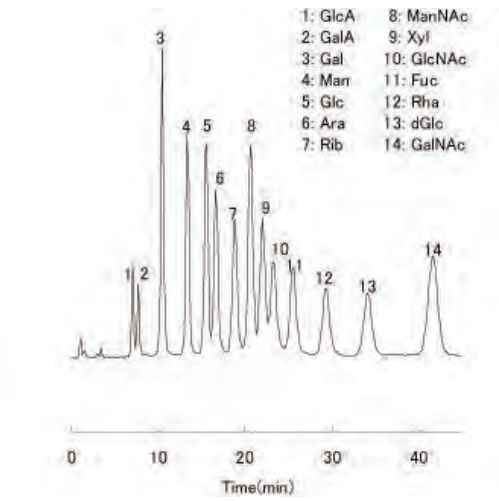
Product for Analysis of Sugar Chains

Background

Sugar chains are well known to function through binding with proteins (glycoproteins) and lipids (glycolipids) in the cell. Glycoproteins and glycolipids has been shown to have various roles *in vivo*.

Features and Advantages

- This kit is capable of rapid and efficient labeling by 6 pi-electrocyclization reaction process of hexatriene-β-carbonyl compound.
- This kit reacts only with the lysine residue on the protein surface and the bonds covalent bond.
- Since it does not react with N-end amino group or lysine residue group, which is indispensable for interaction of receptors, the function of biomolecules is not lost.
- In the sample of very low concentration, it can perform labeling efficiently.



When the concentration of the reagent is used by about ten times, the concentration of the labeling sample can be decreased to 10^{-8} M or less level.

Counter-Diffusion Protein Crystallization Kit

Intended Use

A Simplified Crystallization Method in the Capillary with Gel-Tube

Background

Counter-diffusion is a crystallization method in a capillary in which a protein and a reservoir solution diffuse into each other from opposite directions. Both the protein and the precipitant solutions are set to diffuse through the gel, and the concentration gradients of both solutions form in the capillary. The capillary can continuously scan a wide range of crystallization conditions unless crystallization occurs. By fixing the precipitant concentration higher, you canscan a wider range of crystallization conditions. Therefore, a single capillary may be equivalent to many drops in the vapor-diffusion method.

Principle

The crystallization using Crystal-Tube is based on the counter-diffusion method. A capillary is filled with protein solution and a piece of gel-tubing (gel-tube) is attached to the end of the capillary. The capillary is placed into a test tube in which a reservoir solution is poured into.

Features and Advantages

- **Size**
  Very little space is required for crystallization set-up.
- **Easy Set-up**
  The Gel-tube already contains agarose in the silicon tube, making the crystallization set up very easy.
- **Small Protein Sample**
  Only 2 micro-L per screening. Only 10 micro-L per diffractive-grade crystal.
- **Favorable Crystallization Conditions**
  The timing of crystallization can be controlled by Gel-tube length, the amount of protein solution in a capillary, and the concentration of protein and precipitant solution.
- **High Reproducibility and Reliability**
  JAXA (Japan Aerospace Exploration Agency) uses this method for crystallization in space. After crystallizing over 400 different proteins, the Crystal Tube kit has proven its reliability and high reproducibility.
- **Long-term Stability of Crystals**
  Crystals grown in the capillary arestable over the long term, making it easy to soak crystals with another compound, such as a ligand or cryoprotectant.
- **Membrane Protein Crystallization**
  Phase separation due to concentrated detergent in the solution does not occur.

Composition

- Screw-top test tube 16.5×105, glass
  #CFS-MB2004-CRT201, 24 pc
- Gel-Tubing 1.0 (2.0)×1000, silicone
  #CFS-MB2004-CRT202, 1 pc
- Capillary 0.3 (1.1), DURAN® glass

ScriptMAX® Thermo T7 Transcription Kit

Intended Use

ScriptMAX® Thermo T7 Transcription Kit is a translation kit which has been developed with thermo T7 RNA Polymerase as the base. It's characteristic feature is high RNA synthesis capability.

Features

- Allows synthesis of RNA according to your application. By using the accelerator solution, a 2 to 4 times higher concentration of RNA can be obtained.
- Includes all reagents necessary for reaction.

Composition

- Thermo T7 RNA polymerase (50U/ μℓ) 60μℓ ×1 tube
- 10× Basal reaction buffer2)3) 400μℓ ×1 tube
- 5× Accelerator solution 400μℓ ×1 tube
- 25 mM rNTPs mixture 280μℓ ×1 tube
- RNase inhibitor (40U/ μℓ) 30μℓ ×1 tube

λ Protein Phosphatase

Intended Use

λ-PPase can be used to release phosphate groups from phosphorylated serine, threonine, tyrosine and histidine residues in proteins. It should be noted that different proteins are dephosphorylated at different rates. Optimal reaction temperature is 30℃. Inclusion of protease inhibitor cocktail and shortest incubation time is desired when assays are done with crude samples.

Background

λ Protein Phosphatase (λ-PPase) is a Mn^{2+}-dependent protein phosphatase with activity towards phosphorylated serine, threonine, tyrosine and histidine residues. It is the 221 amino-acid product of ORF221 open reading frame on bacteriophage lambda. λ-PPase was expressed as a recombinant protein in *E.coli* and highly purified. This product is an intact enzyme of high quality without tag.

Composition

Form

- 400 U/ μℓ λ-PPase in 50mM HEPES (pH 7.5)
- 100mM NaCl
- 2mM dithiothreitol
- 0.1 mM $MnCl_2$
- 0.1 mM EDTA
- 50% glycerol
- 0.01% Brij 35.

Reagents Supplied with Enzyme

10× λ-Ppase

Activity

400 U/ μℓ , where one unit is defined as the amount of enzyme that hydrolyzes 1nmole of p-nitrophenyl phosphate per minute at 30℃. Unit definition assays are performed with 50 mM p-nitrophenyl phosphate in λ-PPase buffer, supplemented with 2 mM $MnCl_2$ in a 50 μℓ reaction.

Specific Activity

400,000 U / mg

Quality Assurance

Greater than 95% homogeneous protein determined by SDS-PAGE (CBB staining) that contains no detectable protease activity.

Separation and Purification

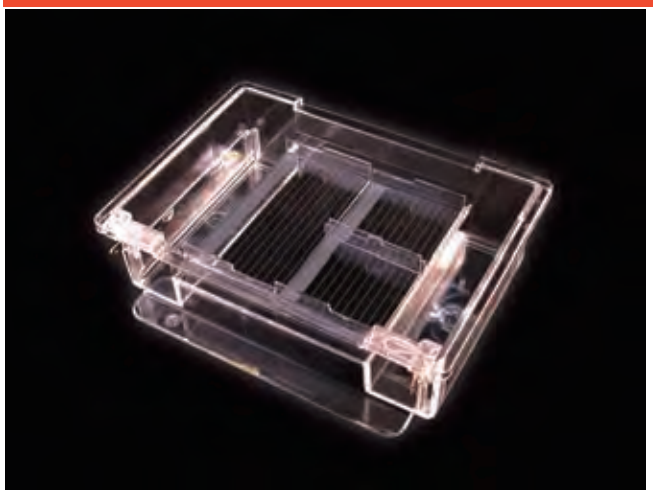
i-MyRun II Electrophoresis System

A submarine-type electrophoresis system for running samples (nucleic acid) in an agarose gel

- A wide range of voltage selection (50V, 75V, 100V, 120V, 135V)
- Timer(0-99minutes) – Also capable for continuous operation
- High-throughputable function
- Compatible with 8 and 12 multichannel pipettes
- Gel electrophoresis tank cover is designed for high level of the agarose gel and sufficient heat release from the tank
- UV transmitting gel electrophoresis tank and gel tray
- Power supply and gel electrophoresis tank integrated model

New

Features

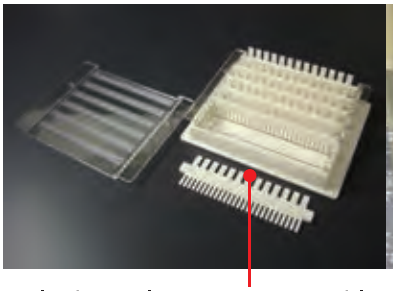


- Gel electrophoresis tank has grids that support mini gel usage.

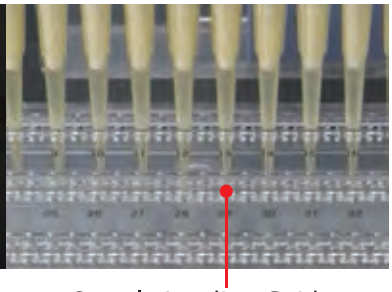
- Electrophoresis will not start unless power supply and gel electrophoresis tank are connected.

- A secure design where electrophoresis run will stop when gel electrophoresis tank cover is taken off.
- CF approved and UL certified model.
- Waterproof control panel.
- Gel electrophoresis tank designed to prevent water leakage.

- Power supply can be easily detached from gel electrophoresis tank by rotating it.



Multichannel pipette compatible formats (13 wells and 26 wells).



Sample Loading Guide (for multichannel pipettes).

i-MyRun.N for Nucleic Acid

Intended Use

Nucleic Acid Electrophoresis System

Features

Three families
- i-MyRun.N (Electrophoresis System for Nucleic Acid)
- i-MyRun.NC (Mini Electrophoresis System for Nucleic Acid)
- i-MyRun.P (Electrophoresis System for Protein)

Gel Electrophoresis systems

- ALL systems include Power Supply.
- The power supply of i-MyRun.N/P : Constant Voltage and Constant Current w/ Timer
- i-MyRun.N allows high-throughput (96 samples) processing.
- Compatible with eight-and twelve-channel pipettes (multichannel pipettes).
- Slotted migration Chamber lid allows easy gel observation and provides optimal heat dissipation.
- One-touch connectors for easy set up between power supply and migration chamber.
- Magnetic safety-switch prevents current flow if lid is not in place.

i-MyRun.P Electrophoresis System for Protein

Intended Use

i-MyRun.P is designed for the separation of analytical quantities of protein in vertical ready made Multi Gel II polyacrylamide gels (See page 280 for additional specifications.).

Features

- Unique wedge system holds gel plates easily and firmly.
- Electrophoresis buffer on both sides of gel plates for excellent heat dissipation.
- Only a small amount of buffer is required.
- Movable slide plugs allow safely and easily replacement.
- Highly visible wells enable easy sample loading.

Cassette Electrophoresis Unit (Model DPE-1020)
- Designed to meet EN61010-1 safety standards

Photo Box (w/ 3 filters & plate)

Features

- Compatible with transilluminator company models
- Simply put in a digital camera
- Compatible with most digital cameras

Examples

- Gel electrophoresis photography
- Recording of yeast colonies and *E. coli*
- Record of the blotting of a membrane
- Photographing with different lighting

Specifications

Size: 140 ㎜ (W)×120 ㎜ (D)×130㎜ (H)
Lens hole diameter: ϕ 40 ㎜
Weight: approx. 500 g
Filter replacement place: approx. 100 ㎜ from bottom
Size of black-out plate: 300 ㎜×210 ㎜
Max gel size: 110 ㎜ (W)×90 ㎜ (D)
Filter: Red / Yellow / transparent

P-BEAT Electrophoresis Cell

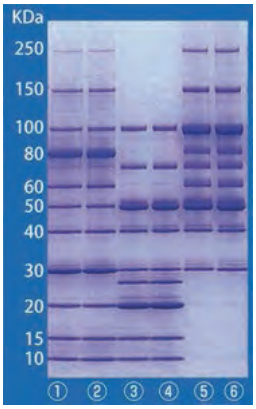
Features

- Easy-To-Use
- 2 gels can be run simultaneously
- Cooling system prevents gel from heating
- High-Voltage-Compatible

Specifications

Dimensions: 145 ㎜W × 115 ㎜D × 150 ㎜H
Buffer Volume: About 700 ㎖
Maximum Sheets: 2

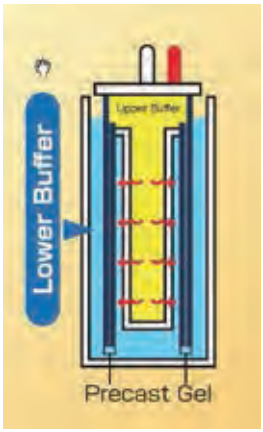
Set up condition for high speed SDS-PAGE
Setting Voltage: 300V-500V
Electrophoresis Time: about 25-40 �min



1,2 lane: SIMASIMA Ladder Broad 5㎕
3,4 lane: SIMASIMA Ladder Low 5㎕
5,6 lane: SIMASIMA Ladder High 5㎕

Electrophoresis device: P-BEAT
Electrophoresis condition: 300V,40�min
Gel: MULTIGEL® II mini 4/20 (13W)
(Gel concentrarion 4-20%)
(#01CUKAO-15EX)

Staining:CBB Staining
(Page Blue 83 stain solution(CBB-R250)DCB-423406)



The unique design of P-BEAT prevents heat boil-up to allow fast, high voltage runs by using the upper buffer chamber to cool the gel and lower buffer.

MULTGEL II Mini

Features

- Always FRESH and Ready-to-Use
- High resolution in short time
- Excellent reproducibility
- Very sharp banding with new comb design
- Can be used for all of native-PAGE, SDS-PAGE, and DNA analyses.

Application

- MUTIGEL II Mini is designed for polyacrylamide gel electrophoresis with the discontinuous buffer system.
- Protein / SDS-polyacrylamide gel electrophoresis (SDS-PAGE) with Laemmli's discontinuous buffer system.
- Protein / native-PAGE with Davis's discontinuous buffer system.
- Deoxyribonucleic acid / PAGE with discontinuous buffer system.
- Well suited for Quality Control (QC) applications.

Specifications

Package：5 gel plates per pack
Gel Size (㎜)：85W×90L×0.9T
Plate Size (㎜)：100W×100L×3.1T

MULTIGEL II Mid Size Gradient Gel

Features

- Always FRESH and Ready-to-Use Form
- High resolution in short time
- Excellent reproducibility
- Very sharp banding with new comb design
- Can be used for all of native-PAGE, SDS-PAGE, and DNA analysis.

Specifications

Package: 5 gel plates per pack (1 or 17 wells)
Gel dimensions: 144mmW×145mmL×0.9mmT
Cassette size: 160mmW×160mmL×5.1mmT

Description	Number of Wells	Acrylamide concentration	MW (Da) / SDS-PAGE	MW (bp) / DNA	Cat. No.	Quantity
MULTIGEL II mid 2D-10/20	1 125(W)×20(L)	10-20%	12-130K	–	DCB-417283	5 sheet

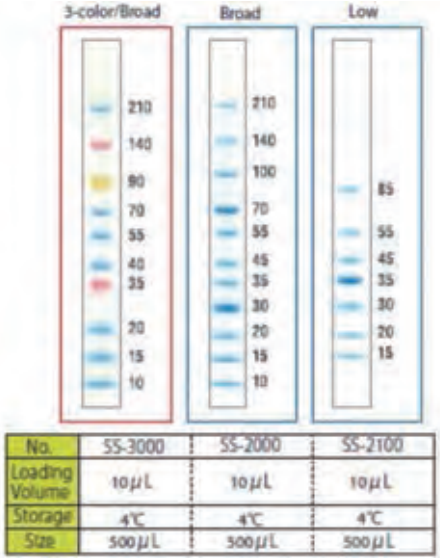
Prestained "SIMASIMA" Protein Ladders

Features

- Suitable for confirming separation during electrophoresis and efficiency of blotting.
- Density of bands can be changed with blotting.
- Estimated molecular weight will be cangable depending on the concetration of acrylamide gel and degree of crosslinking. These markers are not suitable for precise determination of molecular weight.
- Stable for 1 year at temperature conditions under 4℃.



Description	Cat. No.	Quantity
SIMASIMA 3-Color Prestained Broad Range Protein Ladder	DCB-SS3000 DCB-SS3000-3	500 μℓ 3×500 μℓ
SIMASIMA Prestained Broad Range Protein Ladder	DCB-SS2000 DCB-SS2000-3	500 μℓ 3×500 μℓ
SIMASIMA Prestained Low Range Protein Ladder	DCB-SS2100 DCB-SS2100-3	500 μℓ 3×500 μℓ

Unstained "SIMASIMA" Protein Ladders

Features

- Shapes of bands are sharp and conspicuous. Estimate of molecular weight is easy because the bands separate precisely and reproducibly.
- Recommended volume: 5 μℓ for CBB staining, and 0.2 - 0.5 μℓ for silver staining or SYPRO Ruby staining.
- Stable for 1 year under 4C.

Protein Transfer Kit for Semi-dry blotting

Background

Protein electrotransferring from PAG or SDS-PAG to PVDF membrane or nitrocellulose membrane is a widely used method for biological identification and analysis. The Protein Transfer Kit includes protein transfer reagents (developed to provide you with the easy preparation of reagents/operations and the best transfer image in a short period of time in combination with our Multigel II mini), transfer membranes, and filter papers.

Features

- Quick and High efficiency
- High Sensitivity and low background
- All necessary reagents and transfer membrane are included
- Stable storage at room temperature

Composition

Anode Buffer / Tris 500 mℓ
Cathode Buffer / Tris 10000 mℓ
Tranfer Membrane / PVDF membrane 25 sheets
Filter Paper / For qualitative use, 100 sheets

Description	Cat. No.	Quantity
Protein Transfer Kit for Semi-dry blotting	DCB-423536	25 test

6X Loading Dye

Intended Use

Pre-treatment liquid sample preparation. 6×sample loading dye contains BPB (Bromophenol Blue) and Orange G as a staining dyes.

Composition

10 mM Tris-HCl (pH7.5)
50 mM EDTA
30% Glycerol
0.06% BPB
0.12% Orange G

Description	Cat. No.	Quantity
6X Loading Dye	TYB-RE-DYE	1 mℓ

MULTI GEL II mini Dryer

Intended Use

This kit can make a dry stock of Polyacrylamide Gels (PAG) and SDS-PAG.

Components

Multi gel Dryer Starter Set

- Fixing Frame 2 set
- Gel Dryer Reagent 500 mℓ×2
- Pre-cut cellophane 50 sheets

Multi gel Dryer Reagent (For 20 gels)

- Gel Dryer Reagent 500 mℓ×2
- Pre-cut cellophane 50 sheets

It is also usable for 100×100×1.0 mm gel

2D-Silver Stain Reagent II [For 10 gels]

Background

For detection of proteins and nucleic acids migration by polyacrylamide gel electrophoresis, silver staining is now being highlighted as a sensitive staining method.
However the original silver staining method is not necessarily easy to work and takes long-time.
2D-SILVER STAIN-II is an improved reagent kit developed to provide simple and fast staining.

Application

2D-SILVER STAIN-II is applicable to the detection of proteins and nucleic acids subjected to polyacrylamideand SDS-polyacrylamide slab gel electrophoresis.

Features and Advantages

- Rapid staining results in a short time after electrophoresis.
- Staining with higher sensitivity
  For proteins: 50 to 100 times more sensitive than CBB staining
  For nucleic acids: 50 to 100 times more sensitive than EB staining
- Simple preparation and simple operation.
- No use of such materials as heavy metals controlled by regulations.
- Capable of restaining CBB-stained gels. (Double-staining)
- Staining process can be stopped any time during development for desired chromatic figures.

Components

- Fixing Reagent (Thiourea) 100 mℓ×1
- Pretreatment reagent (Dithiothreitol, Glutar-aldehyde, Thiourea) 100 mℓ×1
- Staining Solution A (Silver nitrate) 100 mℓ×1
- Staining Solution B (Ammonium hydroxide, Sodium hydroxide) 100 mℓ×1
- Concentrated developer (Citric acid, Folmaldehyde, Sodium hydroxide) 100 mℓ×1
- Stopper (Citric acid) 100 mℓ×1

Screener Blotter Mini 56

Intended Use

Tools for antigen-antibody reaction after Western Blotting

Features

- Membrane does not need to be cut
- Minimize amount of antibody
- Easy-to-use
- Tight cover prevents mixing of samples between the channels

Specifications

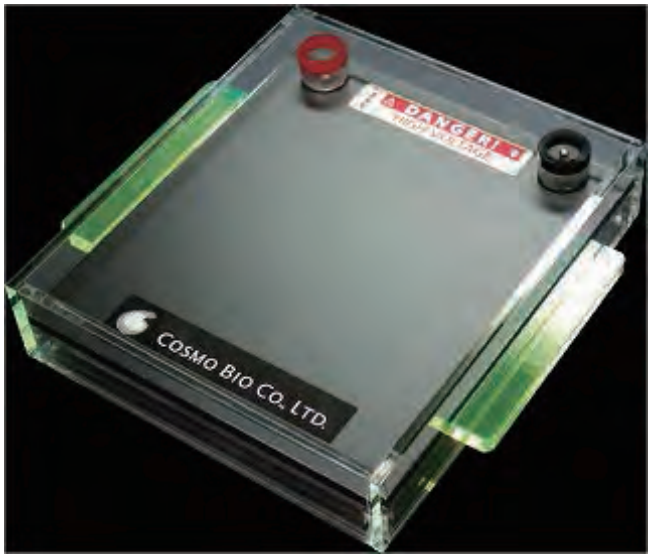
- Number of Channel: 56
- Application: Mini Gel size
- Use of antibody per channel: 85 μℓ
- Dimension: 150 ㎜W×224 ㎜D
- Content: main unit / bolt x7 / handle for exclusive use / support sheet for exclusive use

Description	Cat. No.	Quantity
Screener Blotter Mini 56	SAN-0903-EX	1 unit

Transfer Apparatus, Semi Dry and Flat Type

Specifications

- Size of electrode : 120×120 ㎜
- Weight : 1.3 ㎏
- Packing size : 140 (L)×200 (W)×130 (H) ㎜



Description	Cat. No.	Quantity
Transfer Apparatus, Semi Dry and Flat Type	CBJ-IMR-100-EX	1 set

Ab-Capcher™

Intended Use

IgG Purification Tool Outperforms Protein A and G

Background

Ab-Capcher™ is ProteoNova's patented "Protein A-R28" (Protein A variant) bound at high density to a supporting gel matrix offering many practical advantages for the routine purification of rat and mouse IgG including broader subclass specificity and high capacity binding.

Ab-Rapid PuRE™ is a specially designed syringe-type column unit prepacked with AbCapcher offering maximum convenience for Ig purification.

Ab-Rapid SPiN™ is a convenient spin column prepacked with Ab-Capcher.

Protein A-R28 is an alkali-tolerant IgG-binding protein derived from protein A, which is developed with ProteNova's patent technology. Protein A-R28 strongly binds to various species and subclasses of IgG, compared with Protein A and G. The coupling to resin (Ab-Capcher™) provides an alkali-washable unique affinity medium with high binding capacity for immunoglobulin, which is useful for purification of human, rabbit, and mouse IgGs including mouse IgG1. Ab-Capcher™ is also useful for immuno-precipitation experiments.

Features and Advantages

- 5 times the binding capacity of Protein G
- Labile antibodies can be bound at neutral pH
- Low non-specific binding
- IgG puirty >95%

Ab-Capcher™ Ab-Rapid PuRe™ Ab-Rapid SPiN™

Ab-Capcher ExTra™

Intended Use

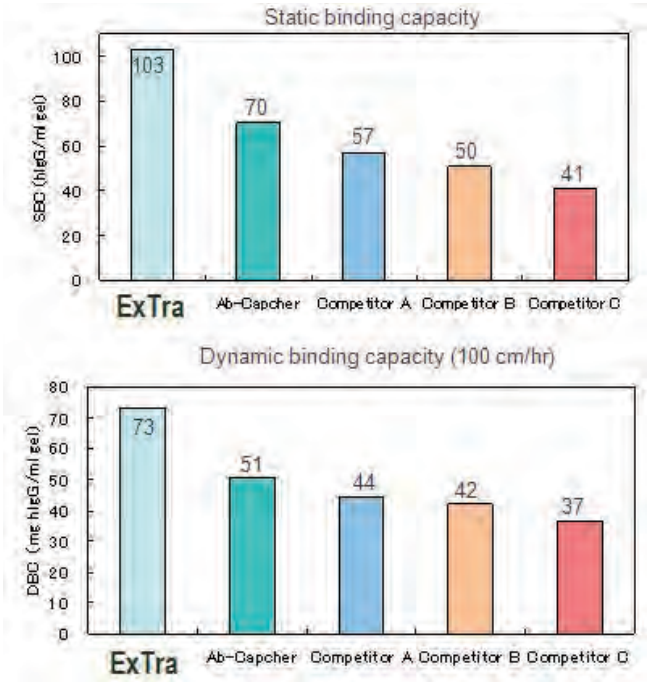
Alkali-resistant affinity medium for IgG purification

Background

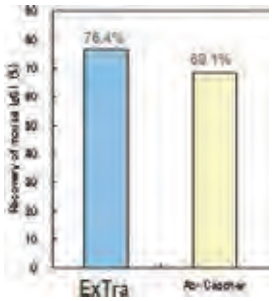
Ab-Capcher ExTra™ is an alkali-resistant affinity medium for IgG purification, which is coupled with an alkali-resistant Protein A-derivative (Protein A-R28) designed for even higher IgG-binding capacity than of Ab-Capcher™. The dynamic binding capacity of Ab-Capcher ExTra™ is apporoximately 70 mg human IgG/mℓ of medium at 100 cm/min. Ab-Capcher ExTra™ shows higher binding to mouse and rat IgGs exceeding Ab-Capcher™. Since Pyrogen testing is carried out on an every lot of manufacturing, antibodies purified with Ab-Capcher ExTra™ are suitable for cell-based assay*.
*Recommended that endotoxin-free buffers are used for purification of IgG with Ab-Capcher ExTra™.

Features and Advantages

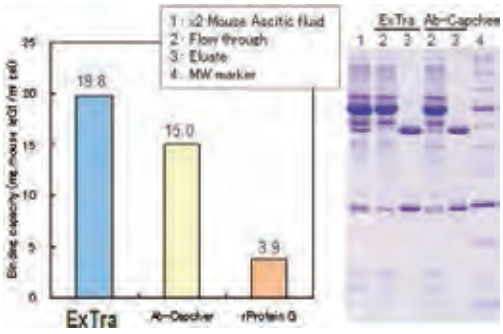
- Dynamic binding capacity (100 cm/hr) is 70 mg/mℓ.
- Reusable by washing with alkali.



Comparison of binding capacities
[Static binding capacity (Maximum binding capacity)]
Excess of human polyclonal IgG was applied to the gel, shaked for 1 hr at RT, washed and eluted at pH 2.8. Amount of IgG in the elute was measured.
[Dynamic binding capacity (Applied to a column)]
Human polyclonal IgG (3 mg/mℓ) was applied to a column (5×100 mm) at linear velocity of 100 cm/hr (0.33mℓ/min). DBC at 10% breakthrough was determined.



Purification of mouse IgG from low-concentration samples by repeated addition
Gel volume: 100 μℓ/column
Sample: Purified mouse IgG1 (0.1 mg/mℓ PBS) 10 mℓ
Repeats: 20 times
As simulation of purification from cultured medium, mouse monoclonal IgG1 at low concentration was purified by repeated addition of the sample. According to the protocol of Ab-Rapid SPiN, 0.5 mℓ of purified mouse IgG1 (0.1 mg/mℓ) was added to a SPiN column set in a centrifugal machine, stand for 4 min with sometimes mixing and centrifuged. These steps were repeated for 20 times. Total 10 mℓ of samples was added to the column, washed and eluted at pH2.8. Recovery (%) with Ab-Capcher ExTra us higher than that og Ab-Capcher, indicating that increasing dispersity of the medium at smaller particle size of 35 μm, influences the recovery of IgG.



Purification of mouse IgG1 from ascitic fluid
Gel volume: 50 μℓ/column
Sample: 1 mℓ of mouse ascitic fluid, x2 diluted with PBS
Incubation with gel: 2 hrs
Mouse ascitic fluid was 2-fold diluted with PBS, applied to gel and shaked for 2 hrs. After washing, IgG was eluted at pH 2.8. Ab-Capcher ExTra shows 5.1-fold higher amount of IgG binding than that of Protein G gel and 30% higher than that of Ab-Capcher.

Magnosphere™ MC290/Streptavidin

Background

Magnosphere™/Streptavidin beads are well-designed magnetic microparticles for cell separation. The surface is covered with a hydrophilic polymer chemically conjugated with Streptavidin, which specifically binds to biotinylated molecules. These chemistries enable you to separate specific cells from whole blood or cultured cell suspension using a biotinylated cell-specific antibody. The uniform particle size and superparamagnetic character of the particles help rapid magnetic separation and secure re-suspension.

Features

- Uniform particle size
- Super-paramagnetic
- Rapid magnetic responsiveness
- Low non-specific binding of cells
- Shows no influence on cell proliferation and differentiation
- Compatible with PCR assay

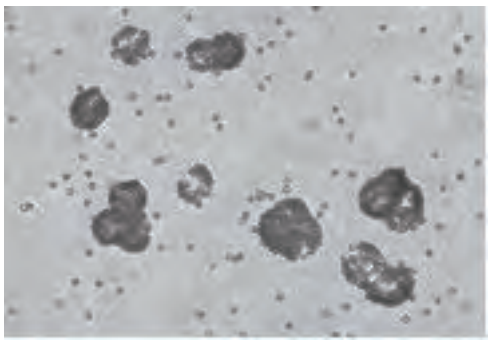
Application

Specific cell separation from whole blood or cultured cell suspension

Specifications

- Bead diameter: 3 μm (micrometer)
- Package volume: 2 mℓ
- Solid content in slurry*: 1 % (10 mg/mℓ)
- Dispersion media:
  TBS* + 0.01 % Tween20 + 0.09 % Sodium Azide
- Bead magnetite content: 20 % approx.
- Biotinylated IgG capacity: 0.5 μg / mg bead approx.
- Shelf life: Labeled on the bottle

* Number of beads: 5×10^7 beads per 1 mg (=100 μℓ) approx.
* TBS: Tris buffered saline, 25 mM Tris-HCl (pH 7.2) / 0.15 M NaCl



Description	Cat. No.	Quantity
Magnosphere™ MC290/Streptavidin	JSR-MSP-C290-SA	2 mℓ

Magnosphere™ MS/Carboxyl

Intended Use

To immobilize probe molecules such as antibodies, proteins and nucleic acids.

Background

Magnosphere™/Carboxyl particles are magnetic microparticles specially designed for bioseparation such as enzyme immunoassay, IP-western blot or nucleic acid hybridization. The surface of Magnosphere™/Carboxyl particles are covered with hydrophilic polymer and carboxyl (-COOH) group, which enable both low non-specific binding and high binding affinity of the probe molecules immobilized on the surface. Probe molecules such as antibodies, proteins and nucleic acids can be immobilized on the surface via amino coupling method.
Magnosphere™ /Low Carboxyl particles are magnetic microparticles specially designed for ultra pure bioseparation prior to high sensitive measurements such as LC-MS. The surface of Magnosphere™/Low Carboxyl particles are covered with hydrophilic polymer and few carboxyl (-COOH) group, which enable both ultralow non-specific binding and high binding affinity of the probe molecules immobilized on the surface. Probe molecules such as antibodies, proteins and nucleic acids can be immobilized on the surface via amino coupling method.

Features

- Uniform particle size
- Superparamagnetic
- Rapid magnetic responsiveness
- Low non-specific binding
- High affinity

Application

- Enzyme immunoassays
- Immunoprecipitation
- IP-western blots
- Nucleic acid hybridization

Specifications

- Bead diameter: 3 μm (micrometer)
- Surface functional group: Carboxyl (approx. 10 nmol / mg beads)
- Bead magnetite content: 20 % c.a.
- Solid content of slurry: 1 % in water
- Preservative: No preservative added
- Shelf life: Labeled on the bottle

Magnosphere™ MS/Tosyl

Background

Magnosphere™/Tosyl beads are magnetic microparticles designed for covalent immobilization of ligands containing -NH2 groups for bioseparation. Their surfaces are covered with a hydrophilic polymer, on which Tosyl group is incorporated as an active group. The Tosyl group makes it possible to immobilize ligands such as antibody without using coupling reagents. As the hydrophobic Tosyl group is eliminated though a coupling reaction, surface of the beads became hydrophilic after the reaction.
This chemistry enables ligands to keep their function high and achieve a high yield and low non-specific binding bioseparation.
Uniform particle size and superparamagnetic property of the Magnosphere™/Tosyl beads help good magnetic separation and re-suspension response.
These characters of the beads are ideal for variety of applications such as enzyme immunoassay, immnoprecipitation-western blot.

Features

- Uniform particle size
- Superparamagnetic
- Rapid magnetic responsiveness
- Low non-specific binding of proteins

Application

- Immunoassay
- Immunoprecipitation-Western blot
- nucleic acid hybridization

Specifications

- Bead diameter: 3 μm
- Package volume: 4 mℓ
- Solid content in slurry: 1 % (10 mg/mℓ)
- Dispersion media: H_2O
- Bead magnetite content: 20 % approx.
- Surface tosyl group density: 80 nmol / mg bead approx.
- Shelf life: Labeled on the bottle

Principle

Antibody, which added to the Magnosphere™/Tosyl beads, is physically adsorbed on the beads at first. Then, the antibody is coupled covalently in progression (Fig.1). The beads became hydrophilic through the progress of coupling since the tosyl is a leaving group.
Physically adsorbed antibody sometime causes loss of long-term stability due to the detachment of the antibody. Increase in reaction time, temperature and addition of salt (such as $(NH_4)_2SO_4$ or Na_2SO_4) reduce the adsorbed antibody. It is also effective to add excess amount of blocking reagent, such as BSA, at the latter period of reaction to get off the antibody from the beads.
Physically adsorbed antibody can be washed out through a washing with ionic surfactant, such as 0.5% SDS, but washing with ionic surfactant may cause loss of antibody affinity.

Magnosphere™ MB/Calboxyl

Background

Magnosphere™/Carboxyl beads are magnetic microparticles designed for immobilization of ligands through physical or chemical means. The particle surfaces are covered with a hydrophobic polymer that has oligomers, and polymeric by-products removed to maximize physical adsorption and chemical coupling through carboxyl groups.

Features

- Uniform particle size
- Stable matrix
- Superparamagnetic
- Rapid magnetic
- Zesponsiveness
- Oligomer free
- Maximized for physical adsorption
- Maximized for chemical coupling through carboxyl surface groups

Application

- Immunoassay
- nucleic acid hybridization

Specifications

- Bead diameter: 1.1 μm
- Package volume: 5 mℓ
- Solid content in slurry: 2 % (20 mg/mℓ)
- Dispersion media: 0.05 % Nonionic surfactant + 0.09 %
- Sodium Azide in H_2O
- Bead magnetite content: 48 % c.a.
- Surface charge density*: 15 mmol / mg bead c.a.
- Expiration date: Printed on the label

*Surface charge density = amount of carboxyl groups per 1 mg beads

Magnosphere™ MK230/Calboxyl

Background

Magnosphere™/Carboxyl beads are magnetic microparticles designed for immobilization of ligands through chemical means. The particle surfaces are covered with a hydrophobic polymer that has oligomers, and polymeric by-products removed to maximize chemical coupling through carboxyl groups.

Features

- Uniform particle size
- Stable matrix
- Superparamagnetic
- Rapid magnetic responsiveness
- Oligomer free
- Maximized for physical adsorption
- Maximized for chemical couplingthrough carboxyl surface groups

Application

- Immunoassay
- nucleic acid hybridization

Specifications

- Bead diameter: 2.1 μm
- Package volume: 5 mℓ
- Solid content in slurry: 2 % (20 mg/mℓ)
- Dispersion media: 0.05 % Nonionic surfactant + 0.09 %
- Sodium Azide in H_2O
- Bead magnetite content: 40 % c.a.
- Surface charge density*: 15 mmol/mg bead c.a.
- Expiration date: Printed on the label

Magnosphere™ MS300/Streptavidin

Intended Use

To immobilize probe molecules such as antibodies, proteins and nucleic acids.

Background

Magnosphere™/Streptavidin particles are Streptavidin coated magnetic microparticles for bioseparation. The surfaces of Magnosphere™/Streptavidin particles are covered with a hydrophilic polymer to achieve both low non-specific binding and no inhibition of enzyme activity. Consequently, Magnosphere™/Streptavidin particles can be used for PCR amplification systems or enzyme immunoassay systems.

Features

- High affinity to biotinylated proteins or nucleotides
- Uniform particle size
- Superparamagnetic
- Rapid magnetic responsiveness
- Low non-specific binding
- Free of enzyme activity

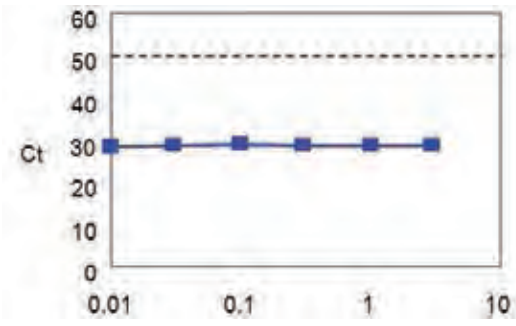
Application

- PCR
- Quantitative PCR
- DNA hybridization
- Capturing biotinylated proteins
- Enzyme immunoassay

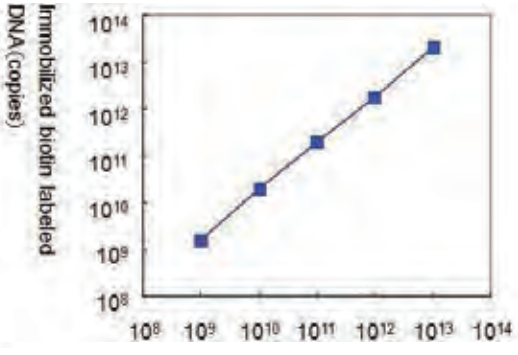
Specifications

- Bead diameter: 3 μm (micrometer)
- Bead magnetite content: 20 % c.a.
- Solid content of slurry: 1 %
- Dispersion media: TBS* + 0.09%Tween20
- Preservatives: 0.09% Sodium Azide
- Biotin binding capacity: 400-600 pmol / mg bead
- Shelf life: Labeled on the bottle

*TBS: Tris buffered saline, 25 mM Tris-HCl pH7.2 / 0.15M NaCl



Added amount of Magnosphere to the PCR cocktail (mg/tube)



Added amount of biotin labeled DNA (copies)

Description	Cat. No.	Quantity

Magnosphere™ MS300/Protein A/AG/G/L

Background

Magnosphere™/Protein A beads are well-designed magnetic microparticles for bioseparation such as immunoprecipitation and antibody purification. Their surfaces are covered with a hydrophilic polymer and chemically conjugated Protein A, which specifically binds to the FC moiety of Immunoglobulin. These chemistries enable you to perform a high yield and low non-specific binding bioseparation in a simple way.

Features

- Uniform particle size
- Superparamagnetic
- Rapid magnetic responsiveness
- High IgG capacity
- Low non-specific binding

Application

- Immunoprecipitation (Protein, Chromatin)
- Antibody purification

Specifications

- Solid content in slurry: 1 % (6×10^8 beads/ mℓ approx.)
- Dispersion media: TBS* + 0.05 % Tween20 + 0.09 % Sodium Azide
- Bead diameter: 3 μm (micrometer)
- Bead magnetite content: 20 % approx.
- IgG capacity : 7 g/mg bead approx. (In case of human IgG)
- Shelf life : Labeled on the bottle

*TBS: Tris buffered saline, 25 mM Tris-HCl (pH 7.2) / 0.15 M NaCl

Magnosphere™ MS300/Papain

Background

Magnosphere™/Papain is papain immobilized magnetic beads which produce Fab and Fc fragments from whole IgG. Papain, thiol-endopeptidase, can be separated from a reaction solution easily by magnetic separation since papain is covalently-immobilized on magnetic beads. Magnetic beads have superparamagetic property and uniform particle size, which give a favorable operability of magnetic separation and beads redispersion. Fab and Fc moieties can be separated by using Magnosphere™/Protein A, liquid chromatography or others way after the digestion of whole IgG.

Features

- Uniform particle size
- Superparamagnetic
- Rapid magnetic responsiveness
- Low non-specific binding

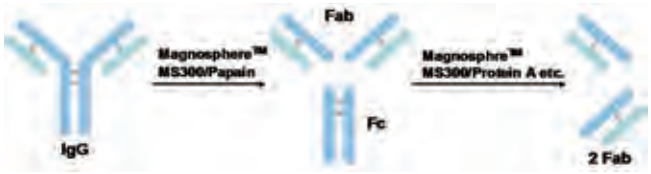
Application

Fragmentation of whole IgG.

Specifications

- Solid content in slurry: 1 % (10 mg/mℓ)
- Dispersion media:
- TBS* + 0.05 % Tween20 + 0.09 % Sodium Azide
- Bead diameter: 3 μm (micrometer)
- Bead magnetite content: 20 % approx.
- Immobilized papain:
  1 mℓ of slurry contains 20 μg (30 Units/ mg) of papain
- Shelf life: Labeled on the bottle

*TBS: Tris buffered saline, 25 mM Tris-HCl (pH 7.2) / 0.15 M NaCl



Description	Cat. No.	Quantity
Magnosphere™ MS300/Papain	JSR-MSP-S300-PAP	2 mℓ

Magnosphere™ MC290/anti-mouse IgG

Background

Magnosphere™/anti-mouse IgG beads are well-designed magnetic microparticles for cell separation. The surface is covered with a hydrophilic polymer and chemically conjugated anti-mouse IgG, which specifically binds to mouse IgG. These chemistries enable you to separate specific cells from whole blood or cultured cell suspension. The uniform particle size and superparamagnetic character of the particles help rapid magnetic separation and secure re-suspension.

Features

- Uniform particle size
- Superparamagnetic
- Rapid magnetic responsiveness
- Low non-specific binding of cells
- Shows no influence on cell proliferation and differentiation
- Compatible with PCR assay

Application

Specific cell separation from whole blood or cultured cell suspension

Specifications

- Bead diameter: 3 μm (micrometer)
- Package volume: 2 mℓ
- Solid content in slurry*: 1 % (10 mg/mℓ)
- Dispersion media:
  TBS* + 0.01 % Tween20 + 0.09 % Sodium Azide
- Bead magnetite content: 20 % approx.
- Origin of anti-mouse IgG: anti-mouse IgG(H+L) goat, Polyclonal
- Mouse IgG binding capacity: 0.5 μg / mg bead approx.
- Shelf life: Labeled on the bottle

* Number of beads: 5×10^7 beads per 1 mg (=100μℓ) approx.
* TBS: Tris buffered saline, 25 mM Tris-HCl (pH 7.2) + 0.15 M NaCl

Description	Cat. No.	Quantity
Magnosphere™ MC290/anti-mouse IgG	JSR-MSP-C290-AMG	2 mℓ

Magnosphere™ MC290/anti-EpCAM IgG

Background

Magnosphere™/anti-EpCAM IgG beads are well-designed magnetic microparticles for cell separation. Monoclonal IgG against Epithelial Cell Adhesion Molecule (EpCAM, CD326) is immobilized on the Magnosphere™ /Streptavidin beads. Surface of the beads is covered with a hydrophilic polymer and chemically conjugated streptavidin. Biotin labeld anti-EpCAM IgG is immobilized on it through a biotin-streptavidin interaction. These chemistries enable you to separate specific cells from whole blood or cultured cell suspension.

Features

- Uniform particle size
- Superparamagnetic
- Rapid magnetic responsiveness
- Low non-specific binding of cells
- Compatible with PCR assay

Application

Specific cell or exosome separation from whole blood or cultured cell suspension

Specifications

- Bead diameter: 3 μm (micrometer)
- Solid content in slurry*: 1 % (10 mg/mℓ)
- Dispersion media:
  TBS* + 0.01 % Tween20 + 0.09 % Sodium Azide
- Bead magnetite content: 20 % approx.
- Immobilized IgG: anti-human EpCAM mouse monoclonal IgG (Clone: B8-4)
- Amount of immobilized IgG: 0.5 μg/mg bead approx.
- Shelf life: Labeled on the bottle

* Number of beads: 5×10^7 beads per 1 mg (=100 μℓ) approx.
* TBS: Tris buffered saline, 25 mM Tris-HCl (pH 7.2) / 0.15 M NaCl

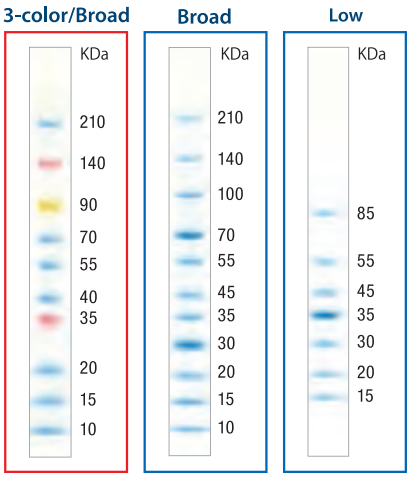
SIMASIMA Ladder

Molecular Sizing Standards for SDS-PAGE and Western Blotting

Free Sample Available!

Ready-to-use. Just Load and Go!

Prestained SIMASIMA-Ladder



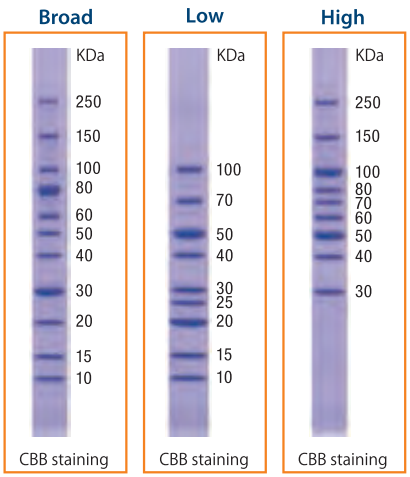
Cat. No.	DCB-SS-3000	DCB-SS-2000	DCB-SS-2100
Volume	500 µL	500 µL	500 µL

Also available as a 3 ladder set

Cat. No.	DCB-SS-3000-3	DCB-SS-2000-3	DCB-SS-2100-3
Volume	3x500 µL	3x500 µL	3x500 µL

- Suitable for monitoring the progress of SDS-PAGE and for assesing transfer efficiency onto membranes after western blotting.
- For accurate molecular weight estimation of protein, use unstained protein ladders.
- Recommended loading volume is 10 µL.
- Stable for one year at 4℃.

Unstained SIMASIMA-Ladder



Cat. No.	DCB-SS-1000	DCB-SS-1100	DCB-SS-1200
Volume	500 µL	500 µL	500 µL

Also available as a 3 ladder set

Cat. No.	DCB-SS-1000-3	DCB-SS-1100-3	DCB-SS-1200-3
Volume	3x500 µL	3x500 µL	3x500 µL

- Band shape is clear and easy to estimate the molecular weight.
- Recommended loading volume is 5 µL (CBB Staining) or 0.2-0.5 µL (silver staining or SYPRO® Ruby Staining).
- Stable at 4℃, 2-3 months at room temperature.

For a FREE SAMPLE, contact Cosmo Bio at export@cosmobio.co.jp

Note: One free sample per laboratory. 3-ladder sets are not available as free samples.

Disposable Items and General Labware

Multi Wash Bottle

Intended Use

Wash bottle for laboratory purposes

Specification

Total height: 330 ㎜
Outer diameter: 85 ㎜
Materials: LDPE (Body), HDPE (Cap, nozzle), PP (Tube connector), HDPE (Leading end of the nozzle), Glass (Weight), PP (Weight cover)

Features

Use it at any angle
The glass ball in the down tube always follows the liquid even upside-
Use even upside down.

No wasted fluid
The bellows bends with the weight of the glass ball to enable even the last drop of fluid to be completely squeezed out.

Touch Burner APT-3

Intended Use

Small and compact burner which does not require a gas hose. The burner can stay on continuously. The flame is adjustable enabling use of the burner for a variety of tasks.

Features

- Stylish, compact and operator comfortable
- Allows comfortable one-handed operation
- Remaining gas amount can be observed easily
- Application is various due to adjustable flame
- Design to prevent wax accumulation in tube
- Easy to refill with standard butane refills
- AA battery included

How to fill the gas
Make sure push button is locked and battery is removed.Set the product upside down before you inset gas cartridge. Fill a gas by inset the gas cartridge (for cigarette lighter) upright to gas inlet on bottom of the product. Do not fill a gas in the vicinity of combustible materials. Please take the body and a gas cylinder with your hand when you fill up.

Specification

Size: 59×141×67 ㎜
Weight: 250 g
1×AA Battery

※We can not provide you with the Gas Bombe. Please purchase appropriate Gas Bombe sold in your country to use with the APT3 Touch Burner.

Description	Cat. No.	Quantity
Touch Burner APT-3	PHD-APT3-EX	1 unit

Handy Homogenizer For Cells & Tissues

Intended Use

Handheld elctromotion and autoclave-resistant homogenizer pestles for 15mℓ, 1.5mℓ, 0.5mℓ and μℓ volumes for various applications including protein and DNA extraction.

Overview

The small but powerful handy homogenizer handheld unit and matching high performance pestles will make your repetitive laboratory procedures easier, faster, and more reproducible. Great for protein or nucleic acid extractions.

Features

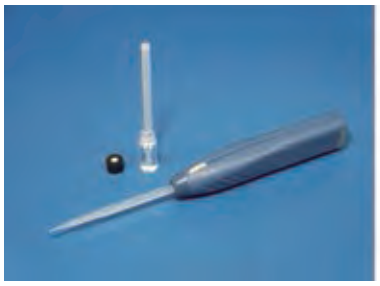
Electromotion Homogenizer Unit

- Completely portable: runs for hours on standard or rechargable AAA batteries
- Lightweight: ～78 g with batteries
- Two models: high speed or low speed / high torque
- Snap-fit system for easy-on / easy-off pestle exchange

PCTFE Homogenizer Pestles

- Ultra hard PCTFE polymer tips insure smooth grinding surface, long life, heat and chemical resistance
- Fully acutoclavable
- Perfect fit for standard 15 mℓ, 1.5 mℓ, 0.5 mℓ tubes, or microliter sized V-vials
- Unique grooved tips (G-types) prevent sample trapping to insure complete homogenization

Homogenizer Microtube Set (1.5mℓ Eppendolf)
Pestles (From Left): LH, PA, SH

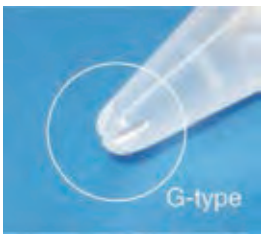


Ultra Micro Homogenizer System for small samples (1-100μℓ) (ISO-ST-22-EX)

Large-head (LH, LHG)
for 1.5mℓ tubes

Pencil (PA)
for 1.5mℓ tubes

Small-head (SH) for 1.5mℓ tubes



Unique grooved tips (G-types) prevent sample trapping to insure complete homogeniza-tion.

For these Homogenizer Pestles, high-level torque type #ISO-23M-R25 mixer is recommeded for usage together.

Handheld Electromotion Mixer

Intended Use

Handheld elctromotion and autoclave-resistant homogenizer pestles for 15mℓ, 1.5mℓ, 0.5mℓ and μℓ volumes for various applications including protein and DNA extraction.

Overview

The Electromotion Mixer base unit is available with two different motors. A high speed model for general procedures, and a low speed/high torque model with special gearing for samples that require maximum grinding power. Both modules have an easy-on/easy-off snap-fit mechanism compatible with all I.S.O. pestles.

Description	Composition	Cat. No.	Quantity
Electoromotion Mixer	Power Source: Two AAA batteries (Alkaline or Rechargable) Speed of revolution: 9000 rpm On/Off Switch: Touch-tone on/off switch Weight: Approximately 78 g (Including batteries)	ISO-23M	1 set
Electoromotion Mixer [DC Coreless Motor and Gear Head]	Type: DC Coreless Motor and Gear Head Power of Source: Two AAA batteries (Alkaline or Rechargable) Speed of revolution: Approximately 350 rpm On/Off Switch: Touch-tone on/off switch Weight: Approximately 75 g	ISO-23M-R25	1 set

Microplate Replicators

Intended Use

- Transfer small volumes of inoculum from microplates to daughter plates or membranes
- Replication of YACs and cosmid libraries
- Dot Blotting
- Colony hybridization
- Antibiotic sensitivity testing
- Phage typing

Features

Pins are made of stainless steel for durability, autoclaving and flame sterilization can be used repeatedly.
Long pins enable usage with deep well and sterilization with burners.

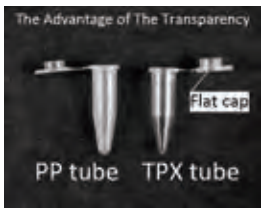
TPX Tube

Features

- TPX Tubes are completely transparent and highly chemically resistant.
- Tubes can be autoclaved.
- Low protein adsorption and suitable for extraction of DNA and RNA.
- Tubes have flat-top caps and bodies for labeling.
- Tubes are ideal for the Closed System Ultrasonic Cell Disrupter, BIORUPTOR.



Composition

Quality of material: TPX
Volume: 1.5 mℓ

Description	Cat. No.	Quantity
TPX 1.5mℓ Micro Tube	HTC-M50001-EX	1000 pc

Incubation Chambers

Intended Use

- For high-temperature *in situ* hybridization
- For all kinds of immunostaining procedures, including fluorescent antibody and enzyme-linked antibody techniques, high temperature *in situ* hybridization, etc.

Features

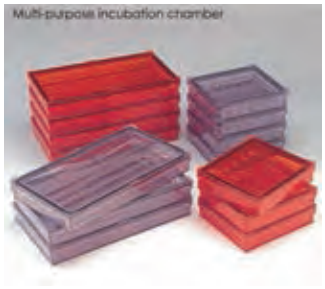
Incubation Chamber

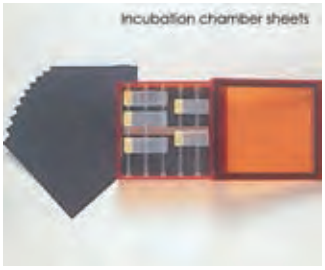
- The chamber interior can be observed at all times.
- Dark orange color reduces transmission of infrared light, making it suitable for fluorescent antibody techniques.
- Two sizes: for 20 or 10 standard slides.
- Heat and cold stable. Use in refrigerator or incubator (-20℃ to + 45℃).
- The incubation chambers are strong for stacking without collapsing.
- Chamber interior can be easily removed and cleaned.
- The position of the slide glass can be shifted.
- The use of high-quality rubber packing maintains proper humidity, making the chamber excellent for long-term storage.
- Resistant to solvents and acids such as alcohol and hydrochloric acid.

High-temperature Incubation Chamber

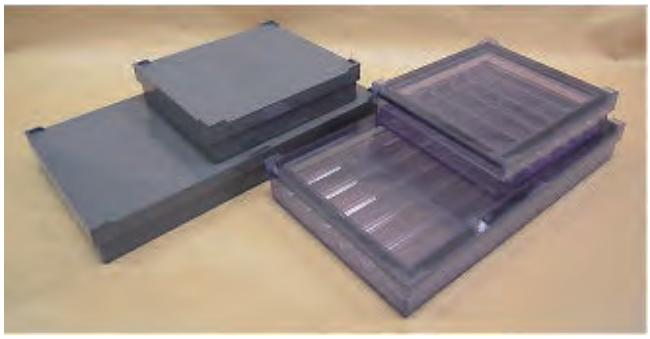
- Stable at -20℃ to +80℃
- Two types: Clear type or Light blocking type
- Two sizes: For 20 or 10 standard slides
- The use of high-quality rubber packing maintains proper humidity, making the chambers excellent for long-term storage.

Note: These chambers are NOT autoclavable.





Spreading out a sheet provides a black background that enables samples to be easily viewed. The sheet are highly water absorbent, if a sheet becomes dirty, it can be replaced quickly and easily.



Incubation Chamber High Temperature Light Shielding model (KMB-20HTLS)

Specification

Large (For 20 slide glasses): 345×195×48 ㎜
Small (For 10 slide glasses): 195×172×48 ㎜

PAP Pen Super-Liquid Blocker

Intended Use

Ready-to-use hydrophobic barrier pen designed for immunohistochemistry applications

Background

This ready-to-use hydrophobic barrier pen is designed for immunohistochemistry applications. The surface tension provided by the circle, square, or any other shapes drawn to tissue sections with the pen, ensures that only the amount of antibody solution needed for the sufficient reaction will be applied. The pen is stable up to 129 ℃ in microwave heat. The PAP Pen is an effective tool for immunostaining procedures by the Peroxidase-Antiperoxidase (PAP) method, ABC method, LSAB method, polymeric method, immuno fluorescence method, ASD method, Enzyme method and Frozen Section method. For paraffin sections, the PAP Pen should be applied after deparallination. For frozen sections, the PAP Pen can be applied after fixation.

Directions to Use

1. Shake well before use. Push down on the tip a couple times to release liquid into the tip.
2. Deparanize tissue sections and hydrate to water. Perform antigen retrieval if necessary.
3. Wipe away excess liquid around the section on slide with Kimwipes or tissue paper.
4. Allow tip to get moderately wet. Encircle the tissue sections or draw lines on both sides of the section and let dry for 10 to 15 seconds.
5. Apply drops of washing buffer to cover the section. Proceed with standard immunohistochemistry procedure

Description	Point Size	Cat. No.	Quantity
PAP Pen Super-Liquid Blocker Mini	2 ㎜	DAI-PAP-S-M	1 pc
PAP Pen Super-Liquid Blocker	4 ㎜	DAI-PAP-S	1 pc

Tissue Capture

Intended Use

The Tissue Capture Pen improves section attachment to glass slides during immunohistochemical staining. It creates a sticky surface on the glass slide ideally suited for paraffin or frozen section attachment. The Tissue Capture Pen greatly improves section adherence throughout long immunostaining protocols.

It can be used in conjunction with the Super Pap Pen Liquid Blocker (Cat.No.DAI-PAP-S) or the Mini Pap Pen Liquid Blocker (Cat.No.DAI-PAP-S-M) which reduce the amount of antibody needed during labeling.

Features

- Provides a sticky membrane on the slide
- Prevents the tissue from moving, wrinkling or falling off the slide
- Flattens the section and eliminates the need for hot water extension
- Suitable for microwave protocols
- Use with Liquid Blocker Pen for small scale cultures Suitable for in-situ hybridization

Description	Cat. No.	Quantity
Tissue Capture	DAI-FP01	1 pc

Tube Checker (Black)

Intended Use

The "Tube Checker" pen enables you to write on paper, plastic, glass and metal. The writings are waterproof after being dried and will not spread with water. After drying, written parts become solvent proof against organic solvents mainly used in the lab such as ethanol, xylene and chloroform.

Usage

The ink will dry in 20 seconds. To prevent ink from smudging, do not touch the ink with wet hands or dip in water before it is dried.

Description	Cat. No.	Quantity
Tube Checker (Black)	DAI-TC-BLACK	1 set

A Color Illustrated Anatomy of the Mouse

Intended Use

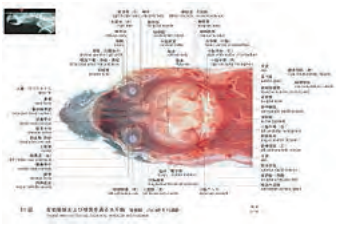
A Color Illustrated Anatomy of the Mouse

Features and Advantages

- Consists of color photographs offering comprehensive and three-dimensional 55 color pages, 2 pages of black and white macro-anatomical photographs (angiograph),and 93 pages of color sectional anatomical photo-graphs (sagittal, dorsal,and transverse sections)
- Anatomical terms in Japanese and English

From the Introduction

The mouse is the most widely used laboratory mammal in biomedical research. It is used to evaluate the safety and effectiveness of new pharmaceutical products, for research in tumor suppression, and vaccine and monoclinal antibody proportional studies. Approximately seven million mice are used for various research projects (JALAS Working Group, 1995) in Japan alone.



While picture information on the anatomies of humans and companion animals (especially dogs and cats) has been described in detail, descriptions of the anatomy of the laboratory mouse are insufficient, apart from atlases focusing on the development of the fetal stages and specific body parts (brain, spinal cord). Detailed knowledge of the anatomy of the mouse has, therefore, become increasingly necessary.

Description	Cat. No.	Quantity
A color atlas of sectional anatomy of the mouse	ADT-AD10001-EX	1 pc

A Color Atlas of Sectional Anatomy of the Rat

Intended Use

A Color Illustrated Anatomy of the Rat

Introduction

Rats are used to research a wide field including preclinical tests, microbiological research, carcinogenic experiments, nutriology, physiology, toxic tests, and pharmacological effectiveness tests. Anatomy is one of the important basic sciences and although much progress has been recently made in the field of human imaging diagnosis, information on sectional anatomy of experimental animals is lacking at present.
A low-speed diamond scroll saw blade was used to obtain preparations for sectional anatomy.

Features

- Cut sections were prepared serially at about 1-3㎜ intervals (sagittal, dorsal and transverse sections).
- The specimens were not fixed but kept in a frozen state so that photographic information close to the living state could be obtained.
- All photographs are in color, and enlarged (A4 size) for detailed observation.
- The anatomical terms are in Eng1ish.
- This atlas provides macro-anatomical photographs making the sectional atlas more comprehensible.

ICE ON

Intended Use

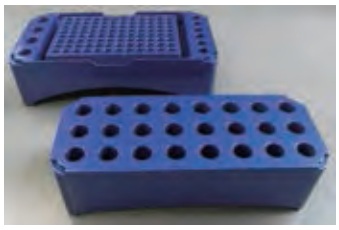
Aluminum made rack for faster refrigeration of sample tubes

Feature and Advantages

- Tubes will not touch water and ice directly
- Made of aluminum and its surface is processed so not to rust for long time use.
- Compactly designed.
- Can be stacked and used as racks sample tubes in refrigerators or freezers.

Type 1:

- 24×1.5 mℓ tubes
- Numbers (1-8) and alphabets (A to C) are inscribed on the surface. Easy to sort out in order.



Type 2:

- 96 tubes of 0.2 mℓ or 12×0.2 mℓ 8-tube strips or 8×0.2 mℓ 12-tube strips or 1×0.2 mℓ 96-well plate and 6 tubes of 0.5mℓ and 4 tubes of 1.5 mℓ.
- Easy to separate tubes of 1.5 mℓ or of 0.5 mℓ from tubes of 0.2 mℓ.

Specification

Material: Aluminum dye cast
Number of Samples: 24 tubes of 1.5 mℓ (3×8)
Dimension Weight: 169×69×47mm, 300 g

Ice on Type 2	SKB-IO-2	1 set

Oxygen Absorber

Background

Oxygen sometimes will have an adverse effect on items used for research and research itself. When such concerns exist, try the oxygen absorption system.
Removal of oxygen can avoid oxidation (rust) and the occurrence of mold. The Oxygen Absorber System consists of oxygen absorbing agents; storage bags and sealing clips.

Usage

- For storage of vitamins, antibiotics, and unsaturated fatty acids which easily oxidize.
- To prevent mold growing on animal and plant-derived reagents and samples, and damage by insects.
- To prevent deactivation of enzymes.
- To maintain amount of bacteria for *Lactobacillus* preparation and anaerobic bacteria formulation.
- To prevent rusting of oxide electrodes and medical instruments.
- To prevent oxidation of electronic materials and components.
- For storage and transport of anaerobic samples.
- For storage of substances that will easily oxidize.
- For removal of residual oxygen, such as after nitrogen gas replacement.
- For removal of oxygen which has leaked or is remaining in a glove box (ISO-A-2500HS).

Features

- Unlike the oxygen for food preservation, the oxygen absorption rate is high. A high quality oxygen-free state can be established.
- Removes causes of oxidation such as mold, allowing an oxygen-free atmosphere to be maintained.
- Presence of an oxygen indicator allows easy indication to detect presence of oxygen.
- A high quality oxygen-free condition can be obtained compared to nitrogen gas replacement, and vacuum sealers. (Oxygen concentration: Less than 0.1%)
- Usage anyway with individual wrappings with aluminum laminated bags.

Disposal Bag

Intended Use

For disposal of waste and hazardous material

Background

The durable bag is made of a special type of polypropylene and can be autoclaved at 132℃. The lid of the rack can be opened by pressing the pedal. The rack is designed for the L-size bags but can also be adjusted for the S and M-size bags. An autoclave indicator tape is included with the bags to confirm that the autoclave has been completed properly. Autoclave within 15 minutes and do not fasten too tight with a clasp or use the heat seal.

Antibodies for Neurodegenerative Disease Research

4R-tau | *C9orf72* | TDP-43 | α-Synuclein

In rapid aging of society, neurodegenerative diseases such as **Alzheimer's disease**, **amyotrophic lateral sclerosis (ALS)**, and **Parkinson's disease** are widely-recognized as a serious problem that needs to be addressed. These unique antibodies offered exclusively by Cosmo Bio are powerful tools in advancing our understanding of neurodegenerative pathologies and mechanisms.

Anti 4R-tau antibody

This anti-4R antibody recognizes 4-repeat tau (4R-tau) isoforms regardless of the deamidation at Asn279 and strongly stains 4R-tau isoforms in AD brain.

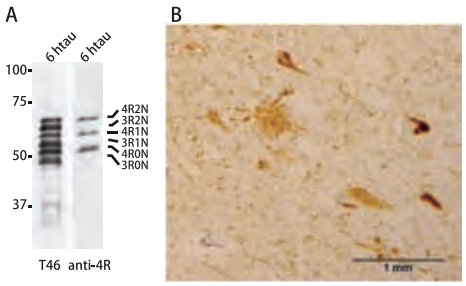

Fig. 1

A: Immuno blot analysis of 6 human tau isoforms (3-repeat and 4-repeat) with anti-tau (T46) and anti-4R (CAC-TIP-4RT-P01).

B: Immuno staining of paraffin embedded section of cerebral cortex prepared from AD brain (pretreated with proteinase K and formic acid)

Anti C9orf72 antibodies

Antibodies raised against dipeptide repeat sequences encoded by *C9ORF72* expansions stain the p62-psositive inclusions in FTLD and motor neuron disease.

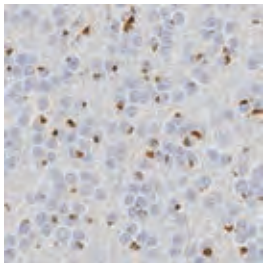

Fig. 2

Immunostaining of the cerebellum of C9orf72 case for poly-GA protein with anti-GA antibody (CAC-TIP-C9-P01) (By the courtesy of Drs Tada and Takahashi in Niigata Univ).

Anti phosphorylated TDP-43 antibodies

Phosphorylated TDP-43 accumulates in pathological inclusions in brains with FTLD-TDP, ALS, AD, DLB and other neurodegenerative diseases.

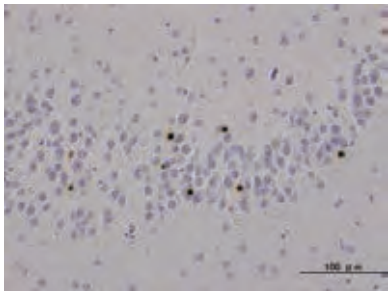

Fig.3 NCIs in dentate gyrus of FTLD-TDP

MAb pS409/410 stains ubiquitin-positive inclusions in FTLD-TDP and ALS without nuclear staining. This does not stain ghost tangles and granulovacuolar degeneration in AD and other related diseases.

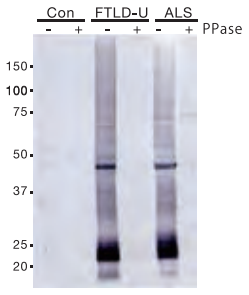

Fig.4

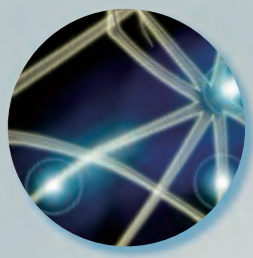
Immunoblot analysis of Sarkosyl-insoluble fractions from control, FTLD-TDP and ALS brains with or without protein phosphatase (PPase) treatment.

Anti α-Synuclein Antibodies

Fine tune your α-synuclein research with these antibodies raised against linear epitopes scanning the human α-synuclein sequence.



Antibodies for Neurodegenerating Disease Research

4R-tau | C9orf72 | TDP-43 | α-Synuclein

Anti 4R-tau Antibody

Description	Host	Immunogen	Cross reactivity	Application	Cat. No.	Quantity
Anti 4R-tau	Rabbit	Human	Human, Mouse, Rat	WB/IHC	CAC-TIP-4RT-P01	50 µL

Anti C9orf72 Antibodies

Description	Host	Immunogen	Cross reactivity	Application	Cat. No.	Quantity
Anti C9orf72 (Poly-GA)	Rabbit	Human	Human	ELISA/IHC	CAC-TIP-C9-P01	50 µL
Anti C9orf72 (Poly-GR)	Rabbit	Human	Human	ELISA/IHC	CAC-TIP-C9-P02	50 µL
Anti C9orf72 (Poly-GP)	Rabbit	Human	Human	ELISA/IHC	CAC-TIP-C9-P03	50 µL

Anti Phosphorylated TDP-43 Antibodies

Description	Host	Immunogen	Cross reactivity	Application	Cat. No.	Quantity
Anti TDP-43, phospho Ser409/410	Mouse	Human	Human	WB/ELISA/IHC	CAC-TIP-PTD-M01	50 µL
Anti TDP-43, phospho Ser409/410-1	Rabbit	Human	Human	WB/ELISA/IHC	CAC-TIP-PTD-P01	100 µL
Anti TDP-43, phospho Ser409/410-2	Rabbit	Human	Human	WB/ELISA/IHC	CAC-TIP-PTD-P02	100 µL
Anti TDP-43, phospho Ser409	Rabbit	Human	Human	WB/ELISA/IHC	CAC-TIP-PTD-P03	100 µL
Anti TDP-43, phospho Ser410	Rabbit	Human	Human	WB/ELISA/IHC	CAC-TIP-PTD-P04	100 µL
Anti TDP-43, phospho Ser403/404	Rabbit	Human	Human	WB/ELISA/IHC	CAC-TIP-PTD-P05	100 µL

【Related products】TDP-43 (Native) Rabbit Antibodies

Description	Host	Immunogen	Cross reactivity	Application	Cat. No.	Quantity
Anti TDP-43 (3-12)	Rabbit	Human	Human, Rat	WB/ELISA/IHC	CAC-TIP-TD-P07	100 µL
Anti TDP-43 (405-414)	Rabbit	Human	Human, Rat	WB/ELISA/IHC	CAC-TIP-TD-P09	100 µL

Anti α-Synuclein Antibodies

Description	Host	Cross reactivity	Application	Cat. No.	Quantity
Anti α-Synuclein (1-10)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P01	50 µL
Anti α-Synuclein (11-20)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P02	50 µL
Anti α-Synuclein (21-30)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P03	50 µL
Anti α-Synuclein (31-40)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P04	50 µL
Anti α-Synuclein (41-50)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P05	50 µL
Anti α-Synuclein (51-60)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P06	50 µL
Anti α-Synuclein (61-70)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P07	50 µL
Anti α-Synuclein (75-91)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P08	50 µL
Anti α-Synuclein (131-140)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-P09	50 µL
Anti α-Synuclein (9 antibodies set)	Rabbit	Human/Mouse	IHC/ELISA/WB	CAC-TIP-SN-SET	9x10 µL

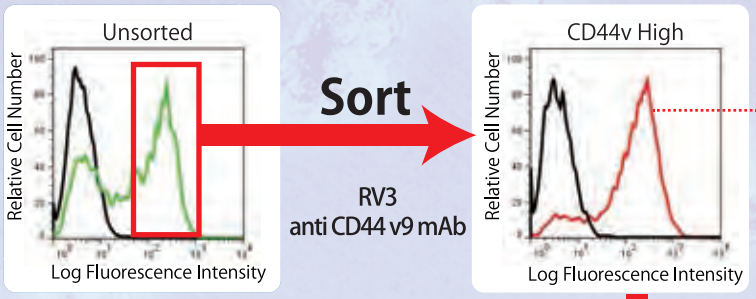
Cancer Stem Cell Enrichment Antibodies!

CD 44 v mAb

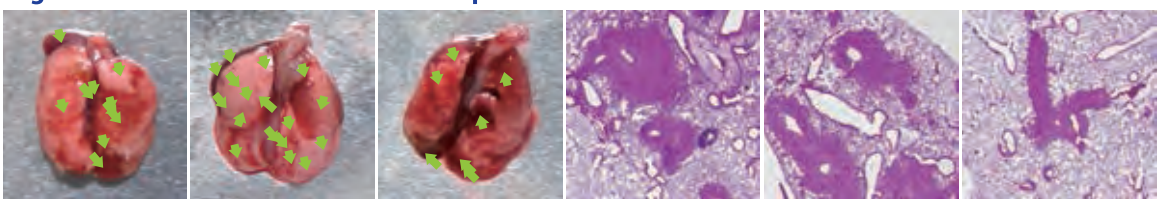
Powerful tools for *in vivo* CSC drug discovery and basic cancer research

Variant isoforms of CD44 (CD44v) are preferentially expressed on cancer stem cells (CSC). These highly specific **CD44v monoclonal antibodies** are well characterized and highly recommended for measuring CD44v expression by flow cytometry and **for enrichment of CSC populations by cell sorting.**

In vivo Lung metastasis assay study showing the high efficiency of CD44 v9-High cell populations sorted from the human pancreatic cancer cell line AsPC-1 to colonize mouse lung.



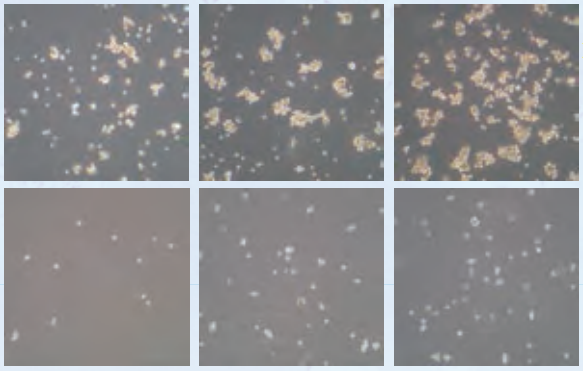
High metastasis formation in a CSC-dependent manner



Green arrows indicate readily observable metastatic colonies following injection of sorted CD44 v9-High cells into mice.
H&E staining is shown at right.

The high efficiency of metastasis (colony) formation by CD44 v9-High cells presents an opportunity to assay the effectiveness of new anti-CSC therapeutic strategies.

In vitro Sphere formation assays with CD44 v9-sorted human PC3 prostate cancer cells



Enriched CSC
High-CSC Population

Low-CSC Population

1,250 2,500 5,000 cells/well

Efficient sphere (tumor) formation by CD44 v9-High cells.

The high efficiency of sphere formation by CD44 v9-High cells presents an opportunity to assay the effectiveness of new anti-CSC therapeutic strategies.
